Heavy flavour
in high-energy heavy-ion collisions

INFN

Andrea Dainese
(INFN Padova, Italy)

Outline of the Talk

- Introduction: HF probes of the medium
- Calibrating HF probes: pp results
- HF production in nucleus-nucleus:
  - Semi-leptonic decays
  - D mesons
  - B and b-jets
- HF azimuthal anisotropy
- Proton-nucleus: control data … and more?
- Outlook: detector upgrades at RHIC and LHC

Outline of the Talk

- Introduction: HF probes of the medium

- HF production in nucleus-nucleus:
  - Semi-leptonic decays
  - D mesons
  - B and b-jets
- HF azimuthal anisotropy
- Proton-nucleus: control data … and more?
- Outlook: detector upgrades at RHIC and LHC

What's special about heavy quarks: probes through the full system history

- Large mass (m_c~1.5 GeV, m_b~5 GeV) → produced in large virtuality Q^2 processes at the initial stage of the collision with short formation time $\Delta t < 1/2m \sim 0.1$ fm $<< \tau_{QGP} \sim 5\text{-}10$ fm
- Characteristic flavour, conserved in strong interactions
  - Production in the QGP is subdominant
  - Interactions with QGP don't change flavour identity
- Uniqueness of heavy quarks: cannot be "destroyed/created" in the medium → transported through the full system evolution

  → "Brownian motion markers of the medium" (*)

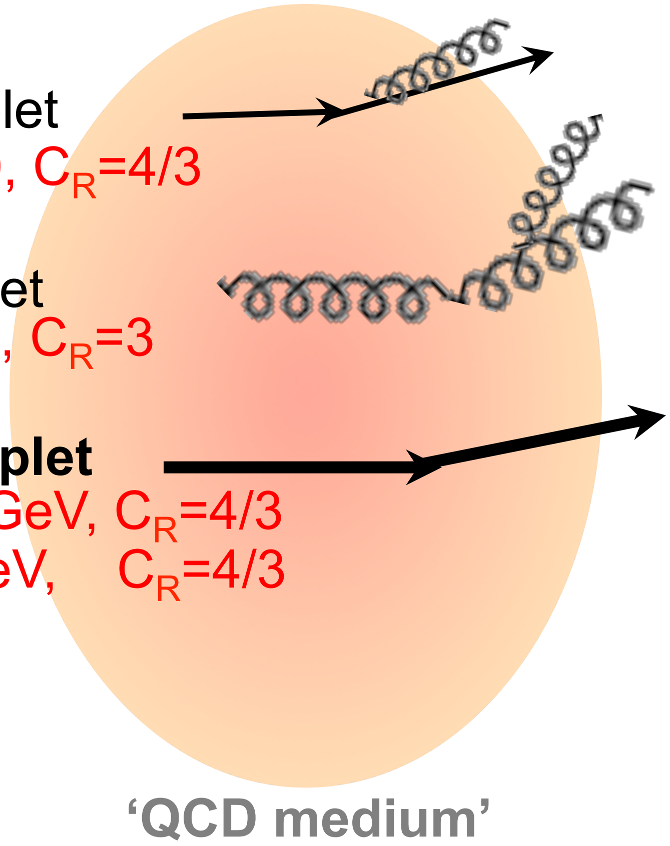
(*) Ralf Rapp

The parton palette
and the properties of QCD energy loss

q: colour triplet
u,d,s: m~0, C_R=4/3

g: colour octet
g: m=0, C_R=3

Q: colour triplet
c: m~1.5 GeV, C_R=4/3
b: m~5 GeV, C_R=4/3



Parton Energy Loss by
- medium-induced gluon radiation
- collisions with medium gluons

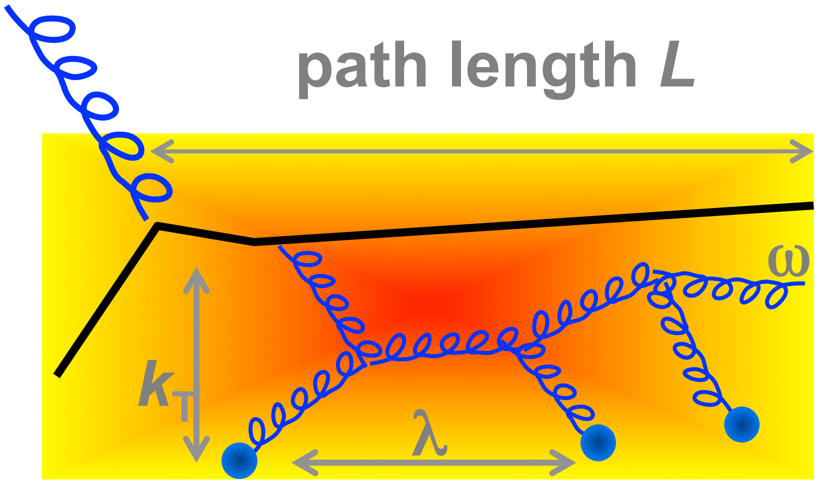
$$\Delta E(\varepsilon_{medium};C_R,m,L)$$

C_R: colour charge dep.
m: mass dependence

→ $\Delta E_g > \Delta E_{c\approx q} > \Delta E_b$

See e.g.:
Dokshitzer and Kharzeev, PLB 519 (2001) 199. Armesto, Salgado, Wiedemann, PRD 69 (2004) 114003.
Djordjevic, Gyulassy, Horowitz, Wicks, NPA 783 (2007) 493.

Radiative energy loss: colour charge dependence …



Example: BDMPS-Z formalism

$$\hat{q} = \frac{\left\langle k_T^2 \right\rangle}{\lambda}$$ transport coefficient

Radiated-gluon energy distrib.:

$$\omega \frac{\mathrm{d}I}{\mathrm{d}\omega} \propto \alpha_s C_R \sqrt{\frac{\hat{q}L^2}{\omega}}$$

C_R = Casimir coupling factor: 4/3 for q, 3 for g

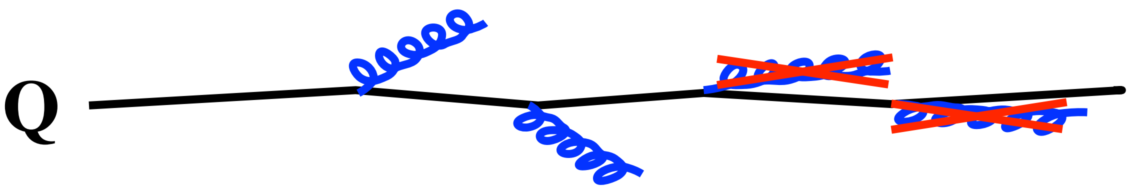
→ Colour charge dependence of radiative energy loss

$$\Delta E_g > \Delta E_{c \approx q}$$

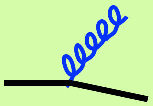
Baier, Dokshitzer, Mueller, Peigné, Schiff, NPB 483 (1997) 291.
Zakharov, JTEPL 63 (1996) 952.
Salgado, Wiedemann, PRD 68(2003) 014008.

… and mass dependence

- In vacuum, gluon radiation suppressed at $\theta < m_Q/E_Q$
  → "dead cone" effect



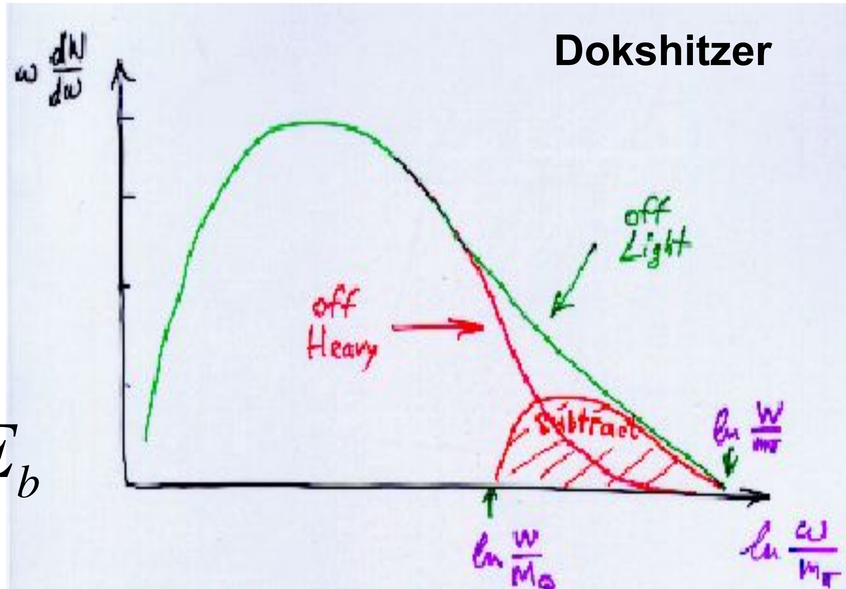
Gluonsstrahlung probability



$$\propto \frac{1}{[\theta^2 + (m_Q / E_Q)^2]^2}$$

- *Dead cone implies lower energy loss* (Dokshitzer-Kharzeev, 2001):
  - energy distribution $\omega dI/d\omega$ of radiated gluons suppressed by angle-dependent factor
  - suppresses high-ω tail

$$\omega \frac{dI}{d\omega}\bigg|_{HEAVY} = \omega \frac{dI}{d\omega}\bigg|_{LIGHT} \times \left(1 + \left(\frac{m_Q}{E_Q}\right)^2 \frac{1}{\theta^2}\right)^{-2}$$



$$\Delta E_c > \Delta E_b$$

Dokshitzer, Khoze, Troyan, JPG 17 (1991) 1602.
Dokshitzer and Kharzeev, PLB 519 (2001) 199.

Mass dependence in collisional energy loss

Example: Langevin formalism

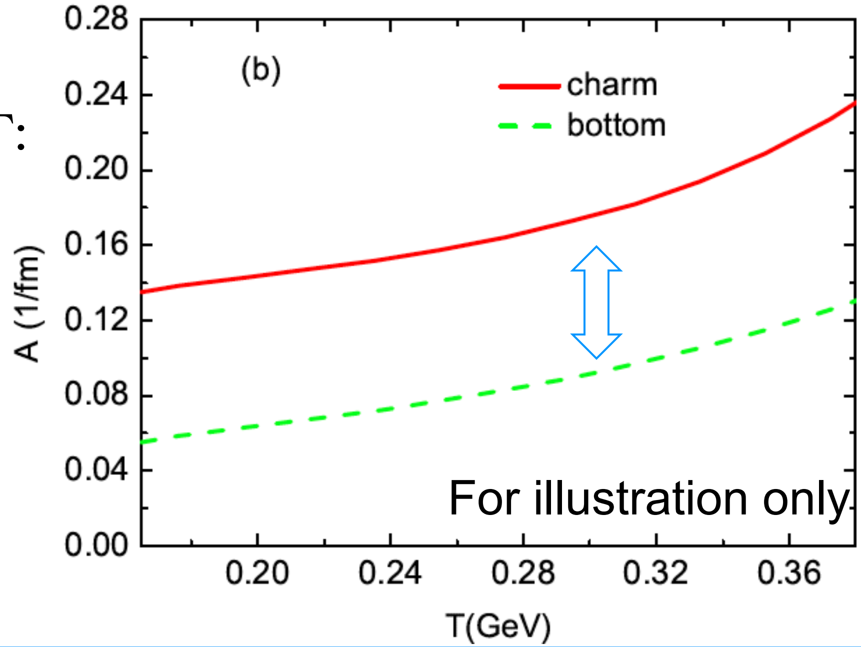
- Langevin equation gives momentum (**p**) evolution vs. time (*t*):

$$d\mathbf{p} = -\Gamma(p)\ \mathbf{p}\ dt + \sqrt{2D(\mathbf{p}+d\mathbf{p})\,dt}\ \rho$$

Loss term → energy loss   Gain term → flow (radial, elliptic)

- Both Γ (drag) and D (diffusion) ~ $1/m_Q$

Thermal relaxation rate A ~ Γ:



$$\Delta E_c > \Delta E_b$$

He, Rapp, Fries, PRC86 (2012) 014903

From energy loss to R_{AA}

$$\Delta E_g > \Delta E_{c \approx q} > \Delta E_b$$

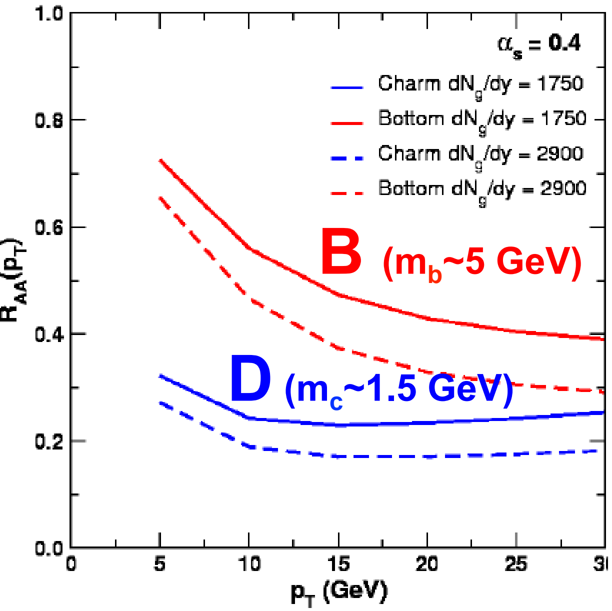
$$R_{AA}(p_T) = \frac{1}{\langle N_{coll} \rangle} \frac{dN_{AA}/dp_T}{dN_{pp}/dp_T}$$

- What is the expected R_{AA} pattern?
  - No trivial relation between ΔE and R_{AA}
  - Need to account for different steepness of partonic p_T spectrum and different fragmentation functions

From energy loss to R_{AA}

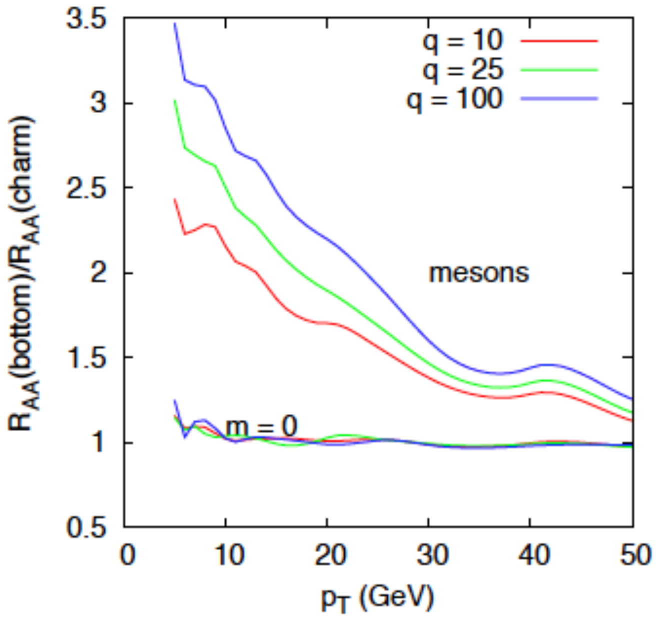
1. Comparing D and B: $R_{AA}^{D} < R_{AA}^{B}$ (below 30 GeV/c)
   - For essentially *all* mechanisms / models
   - Small effect from partonic p_T steepness and fragmentation (at LHC)

Radiative E loss



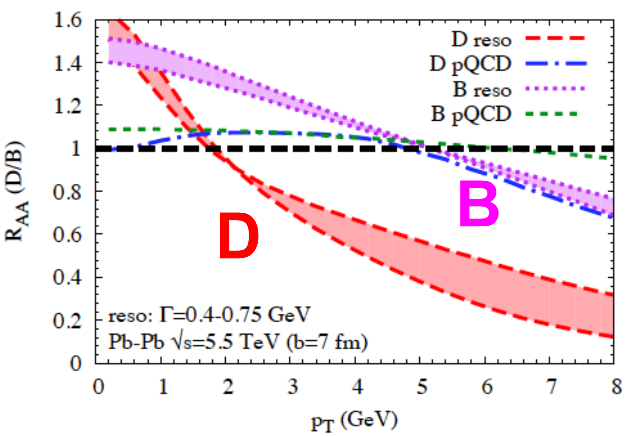
Wicks, Gyulassy, "Last Call for LHC Predictions" workshop, 2007

Radiative E loss



Cacciari et al., "Last Call for LHC Predictions" workshop, 2007

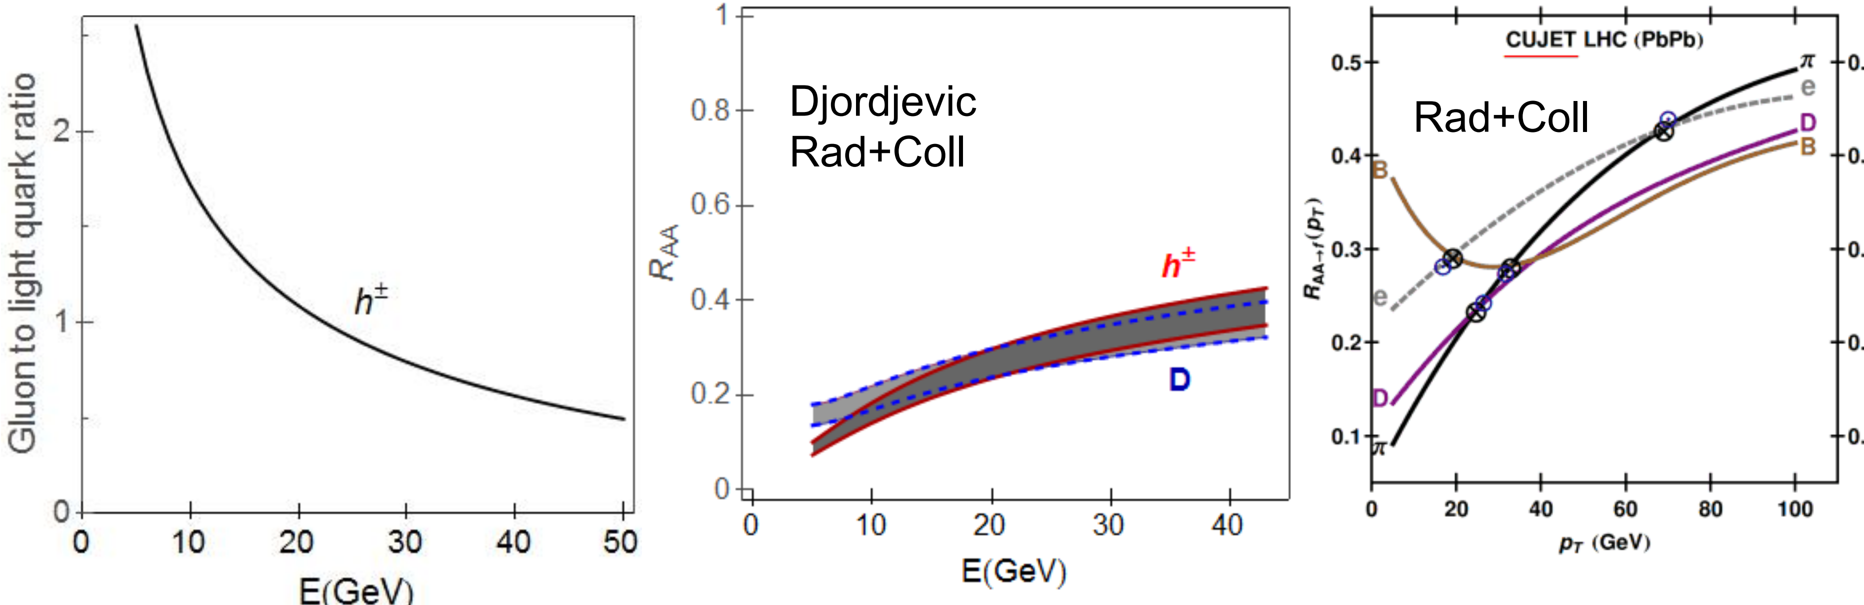
Collisional E loss



Greco et al., "Last Call for LHC Predictions" workshop, 2007

From energy loss to R_{AA}

1. Comparing D and B: $R^D_{AA} < R^B_{AA}$ (below 30 GeV/c)
2. Comparing π and D: $R^{\pi}_{AA} \leq R^D_{AA}$ (below 30 GeV/c)
   - Pions at LHC originate predominantly from gluons, below 10-15 GeV/c
   - The softer p_T spectrum and fragmentation of gluons tends to counterbalance their larger energy loss (colour charge)
   - Predictions range from a moderate difference to almost no difference



M. Djordjevic, arXiv:1307.4702

A.Buzzatti et al., NPA904-905 (2013) 779c

Outline of the Talk

- Outlook: detector upgrades at RHIC and LHC

Heavy flavour production in pp

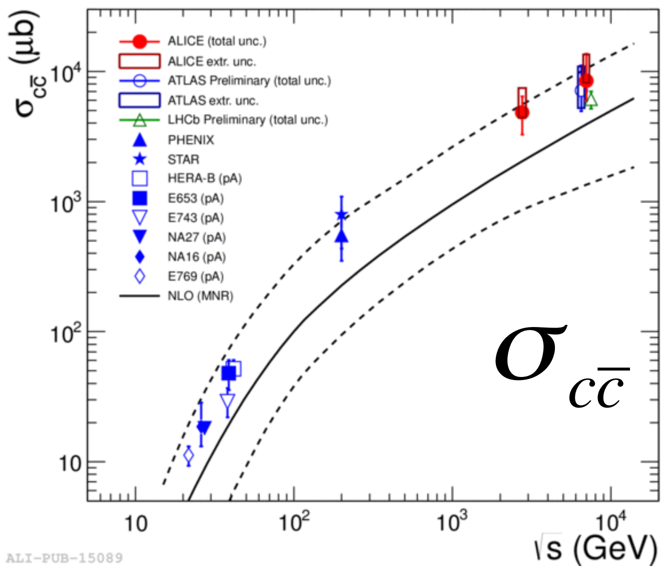
- Example pQCD calculation: Fixed Order Next-to-Leading Log

$$\frac{d\sigma}{dp_T} = A(m)\,\alpha_s^2 + B(m)\,\alpha_s^3 + G(m,p_T)\left[\alpha_s^2 \sum_{i=2}^{\infty} a_i\,[\alpha_s \log(\mu/m)]^i + \alpha_s^3 \sum_{i=1}^{\infty} b_i\,[\alpha_s \log(\mu/m)]^i\right]$$

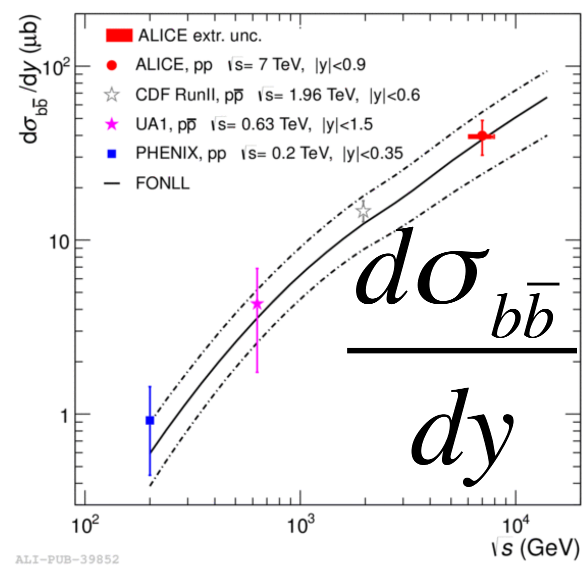
$$\mu \approx p_T$$

FONLL: Cacciari, Frixione, Mangano, Nason and Ridolfi, JHEP0407 (2004) 033

[coincides with NLO for low p_T (total cross section); more accurate at high p_T]



from JHEP1207 (2012) 191



from JHEP1211 (2012) 065

- Describes consistently energy dependence of total cross sections
- Charm (beauty) x10 (100) from 0.2 to 2.76 TeV

pp: pQCD calculations vs data
Charm p_T-differential cross section

200, 500 GeV

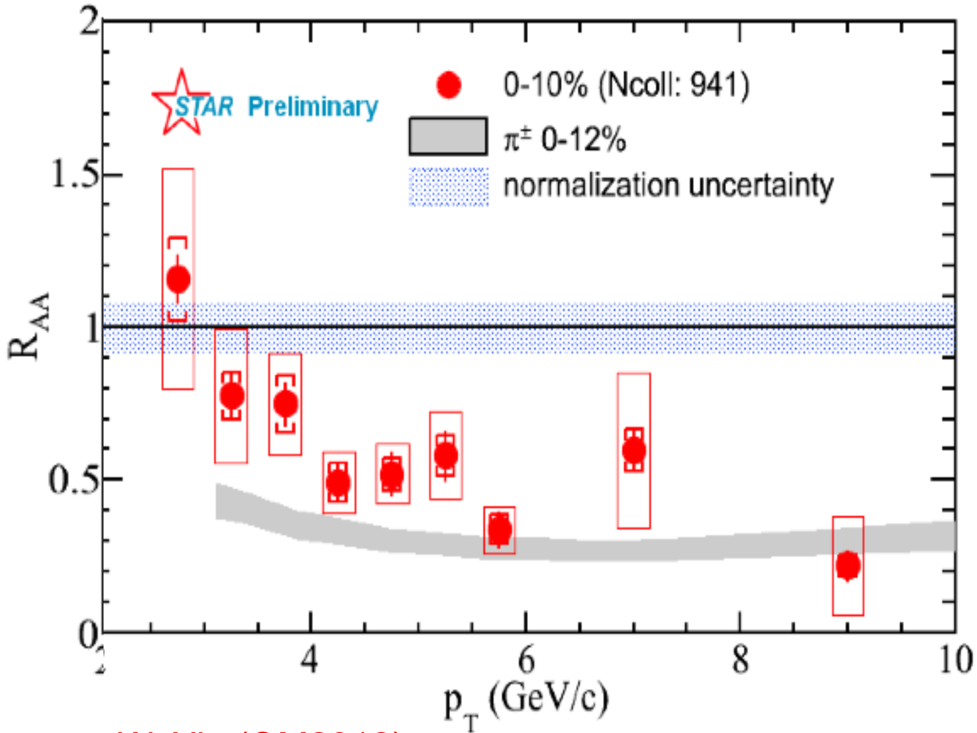
- HF-decay electrons and muons at central and forward y
- FONLL: “b > c” for p_T > 4 (5) GeV/c at RHIC (LHC)

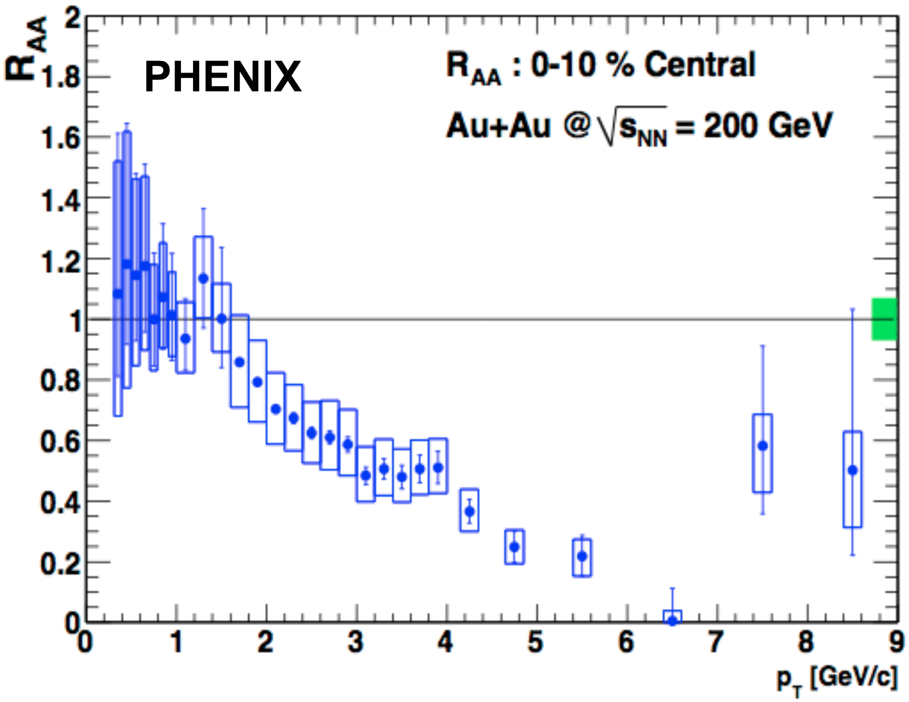
Outline of the Talk

- Introduction: HF probes of the medium
- Calibrating HF probes: pp results
- HF production in nucleus-nucleus:
  - Semi-leptonic decays
  - D mesons
  - B and b-jets
- HF azimuthal anisotropy
- Proton-nucleus: control data … and more?
- Outlook: detector upgrades at RHIC and LHC

HF-decay electrons at RHIC

- Inclusive measurement (c+b) using non-photonic electrons





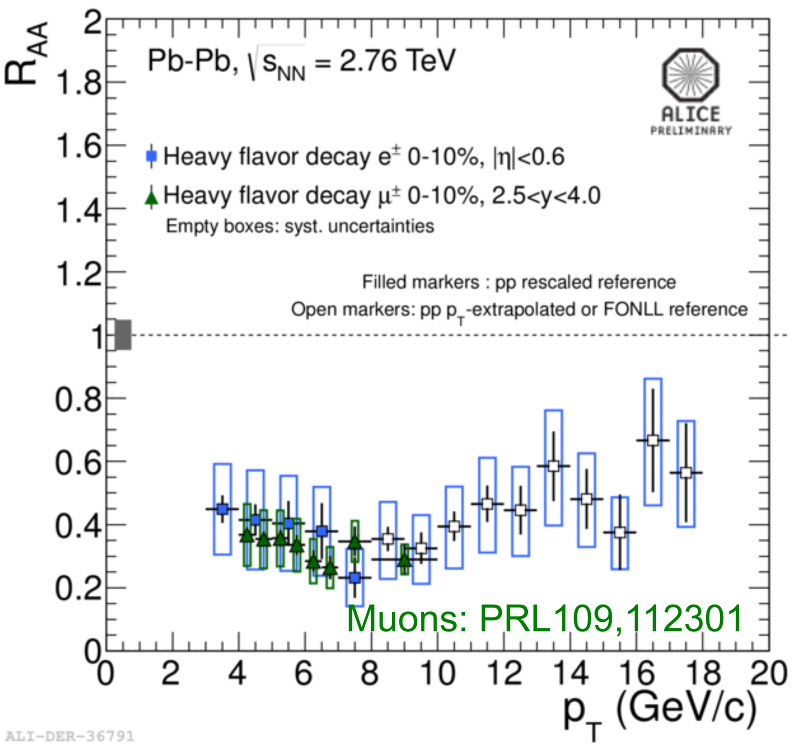
W. Xie (QM2012)
see also Phys. Rev. Lett. 98, 192301 (2007)

Phys. Rev. C 84, 044905 (2011)

- Same suppression as for light-flavour hadrons above 5 GeV/*c*
- Smaller suppression at 2-3 GeV/c, but cannot conclude on mass effects

HF-decay e and μ at LHC: R_{AA} vs p_T

- Electrons and muons from D+B → e,μ decays

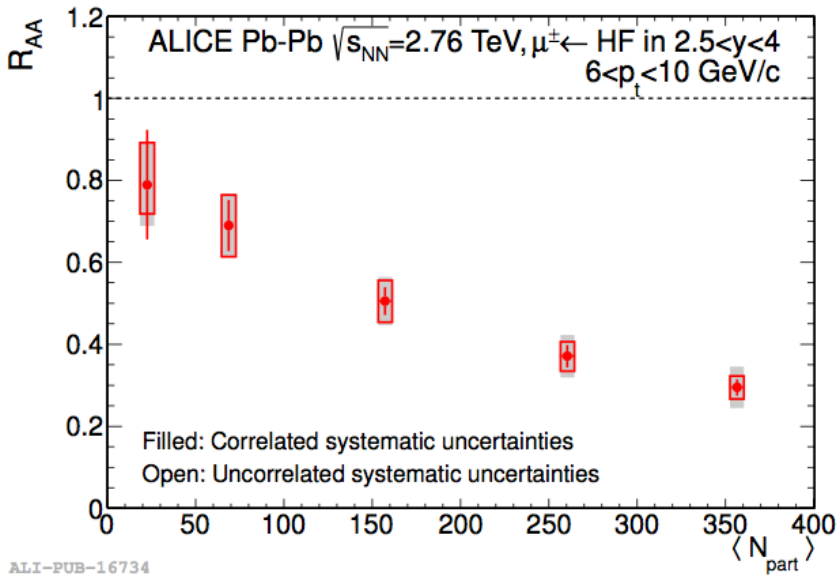


- Comparable suppression at central (|y|<0.6) and forward (2.5<y<4) rapidity

- Suppression by a factor about 2 up to 18 GeV/c
  - Dominated by beauty at such high p_T
  - Note: p_T^{hadron} ~ 2 p_T^{lepton}

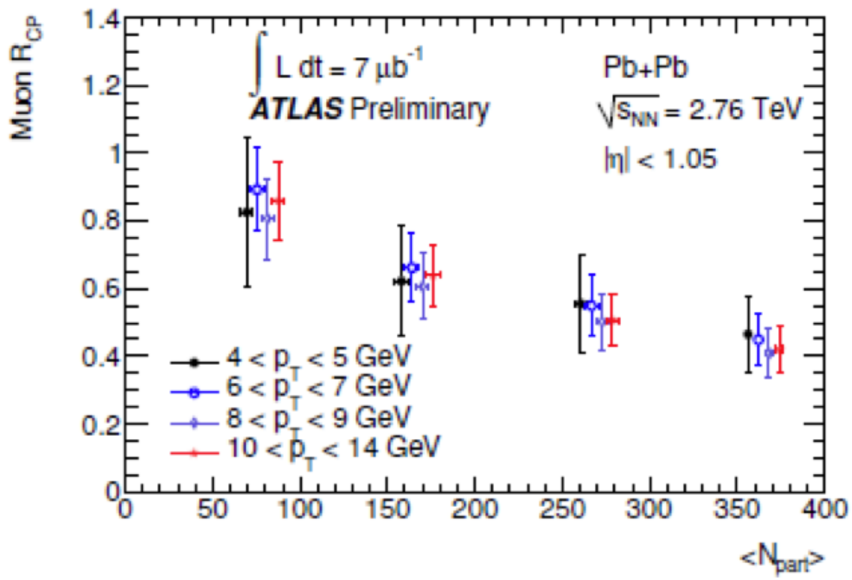
Z.Conesa (QM2012)

HF-decay μ at LHC vs. centrality



PRL 109 (2012) 112301

ATLAS-CONF-2012-081



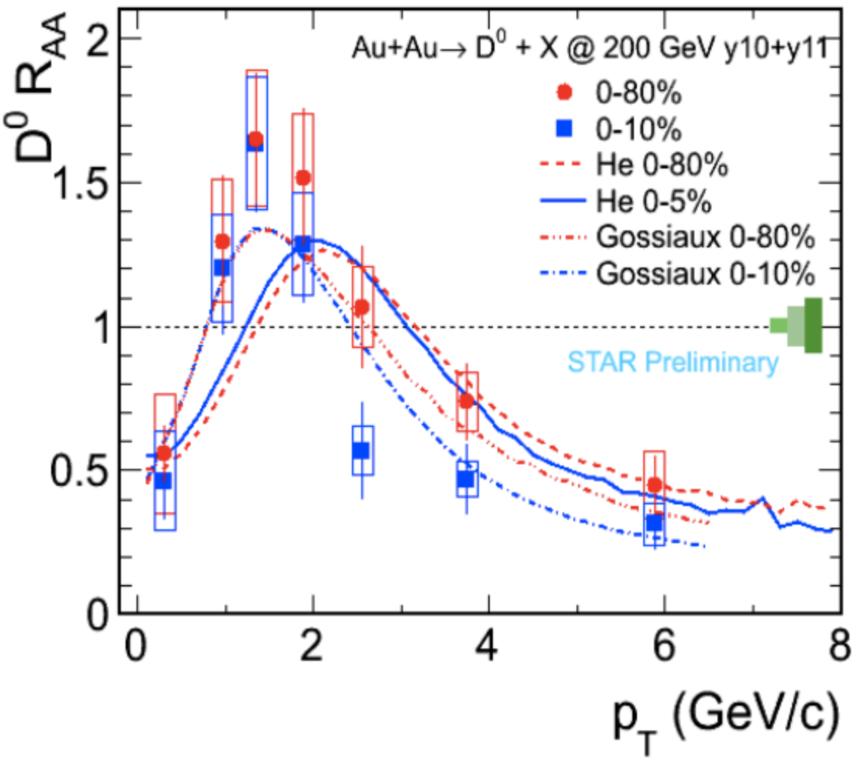
- Clear and consistent centrality dependence for
  - R_{AA} of muons at forward rapidity (ALICE)
  - R_{CP} of muons at central rapidity (ATLAS)
- No sign of p_T dependence from 4 to 12 GeV/c

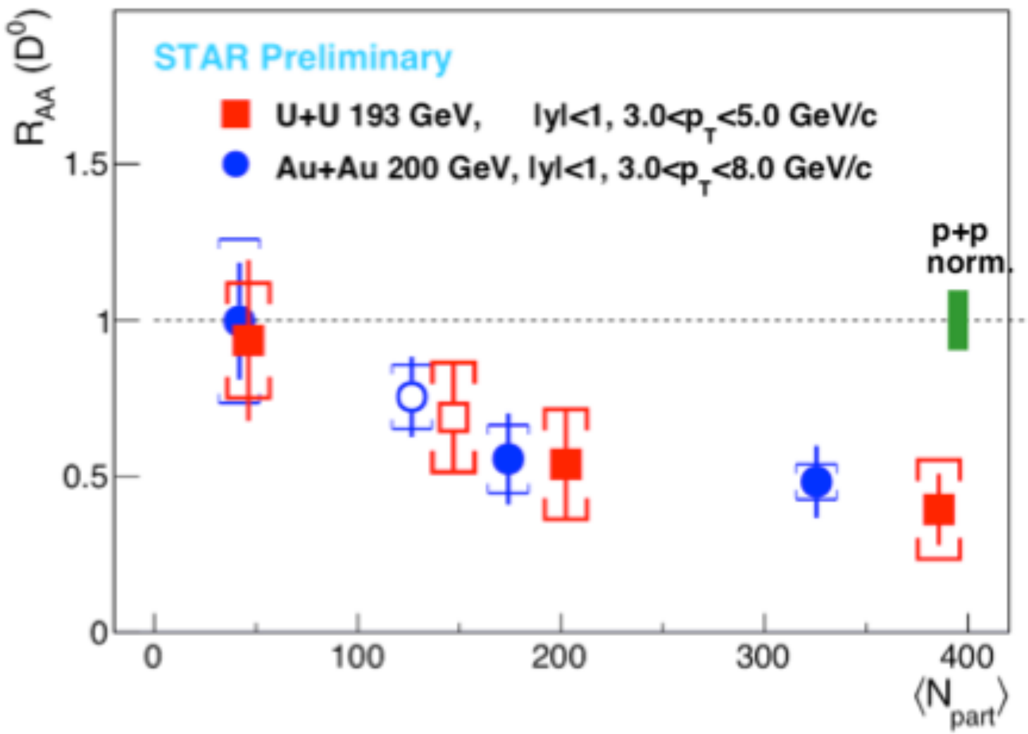
Outline of the Talk

- Introduction: HF probes of the medium
- Calibrating HF probes: pp results
- HF production in nucleus-nucleus:
  - Semi-leptonic decays
  - D mesons
  - B and b-jets
- HF azimuthal anisotropy
- Proton-nucleus: control data … and more?
- Outlook: detector upgrades at RHIC and LHC

Charm: D mesons at RHIC

- STAR: D^0 R_{AA} in Au-Au (and U-U!) at RHIC
  - Without secondary vertex reco, but ~800M Au-Au events

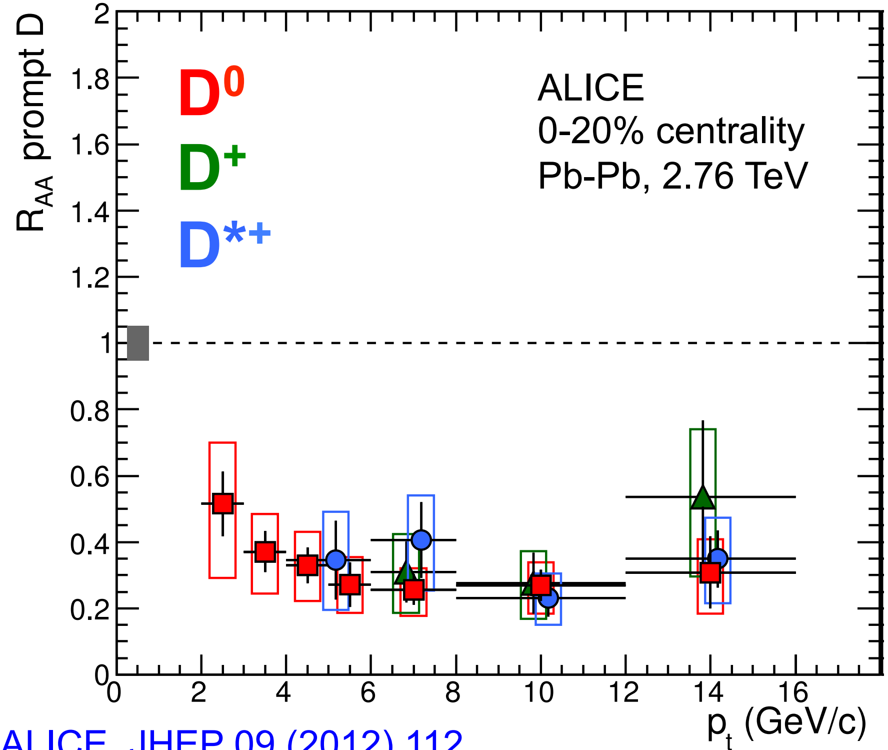




- Suppressed by a factor ~4 at high p_T in central Au-Au
- Large enhancement at 1.5 GeV/c: radial flow + coalescence?

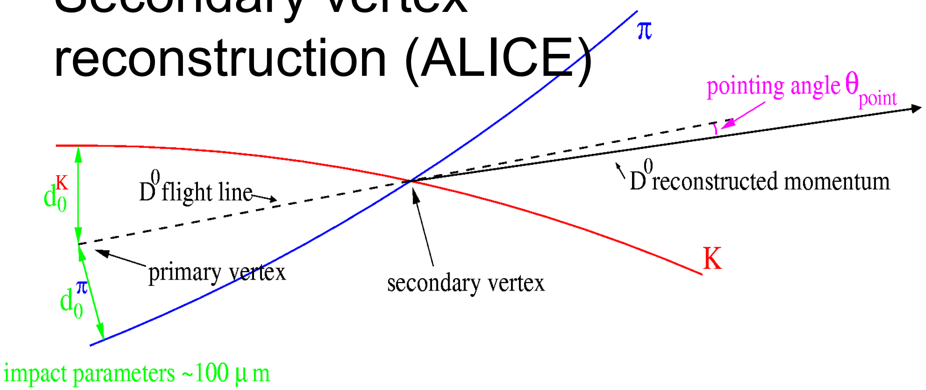
F.Geurts (HP2013)

Charm: D mesons at LHC



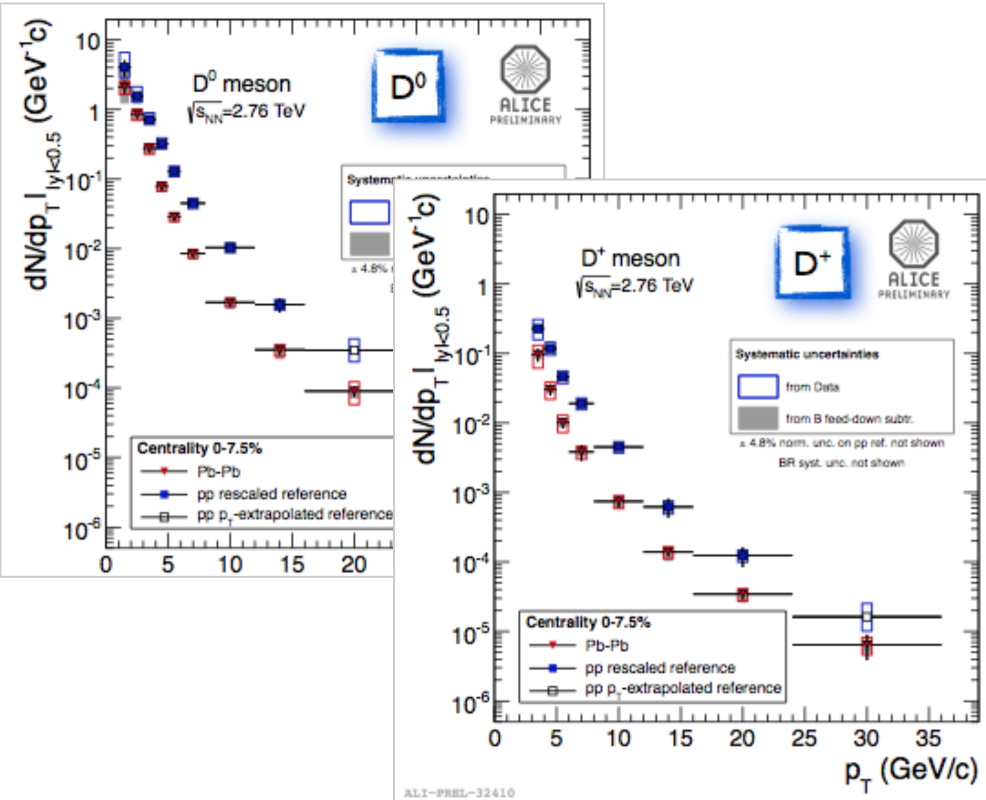
ALICE, JHEP 09 (2012) 112

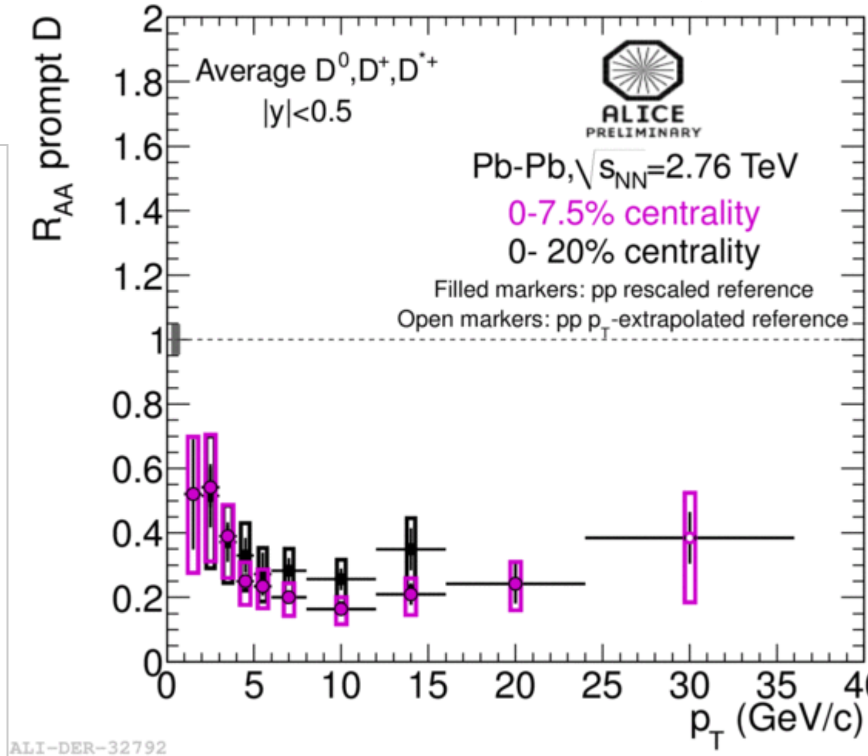
Secondary vertex reconstruction (ALICE)



- First D R_{AA} measurement in heavy-ion collisions, presented by ALICE at QM2011 (LHC run 2010)
  - Strong suppression observed

Charm: D mesons at LHC





- First D R_{AA} measurement in heavy-ion collisions, presented by ALICE at QM2011 (LHC run 2010)
  - Strong suppression observed
- Measurement extended with LHC run 2011, from 1 to 30 GeV/c

Z.Conesa (QM2012)

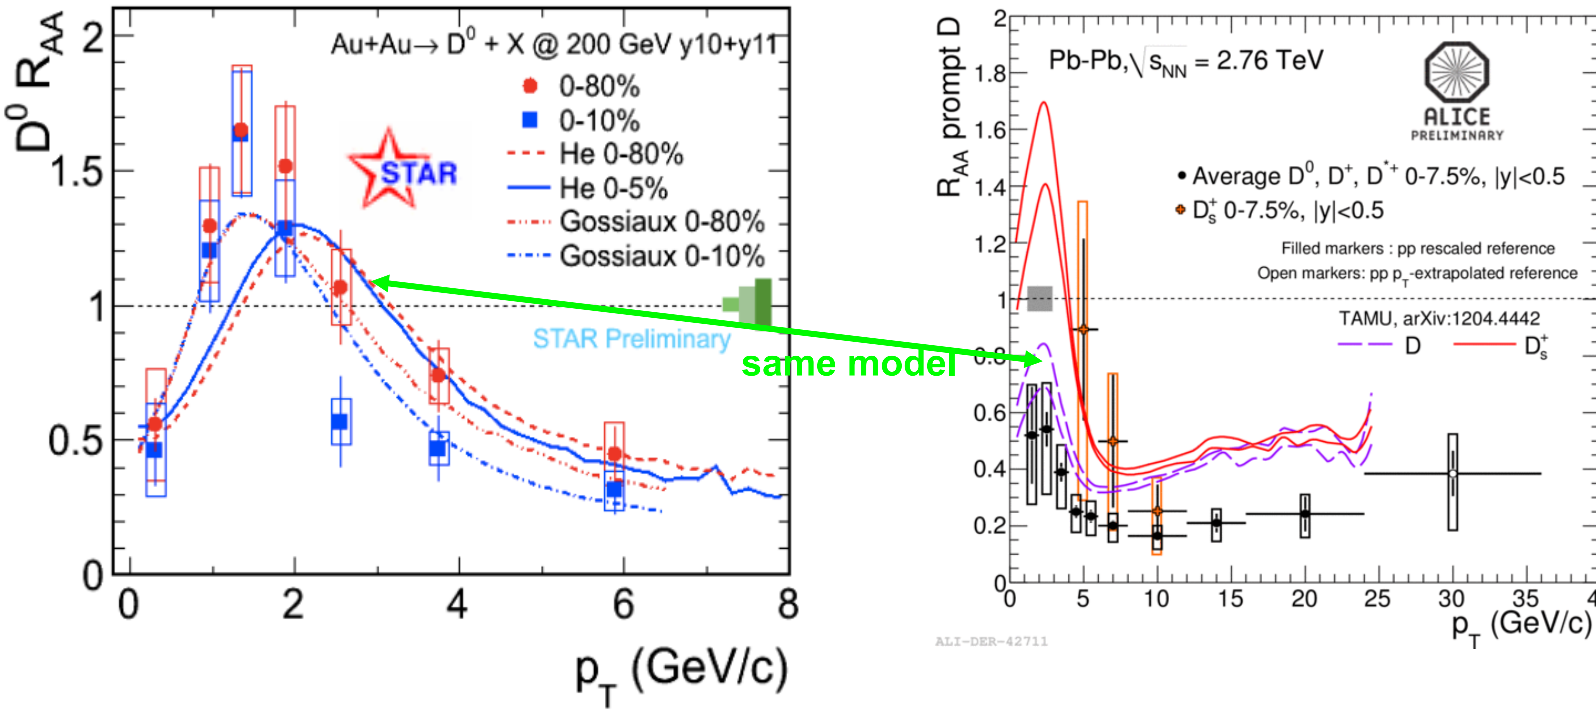
D_s meson R_{AA} at LHC

- First measurement of D_s in heavy ions
  - Large D_s enhancement expected, if *c* quarks recombine in the QGP

  - Data very intriguing, but not conclusive (→next LHC run, upgrades)

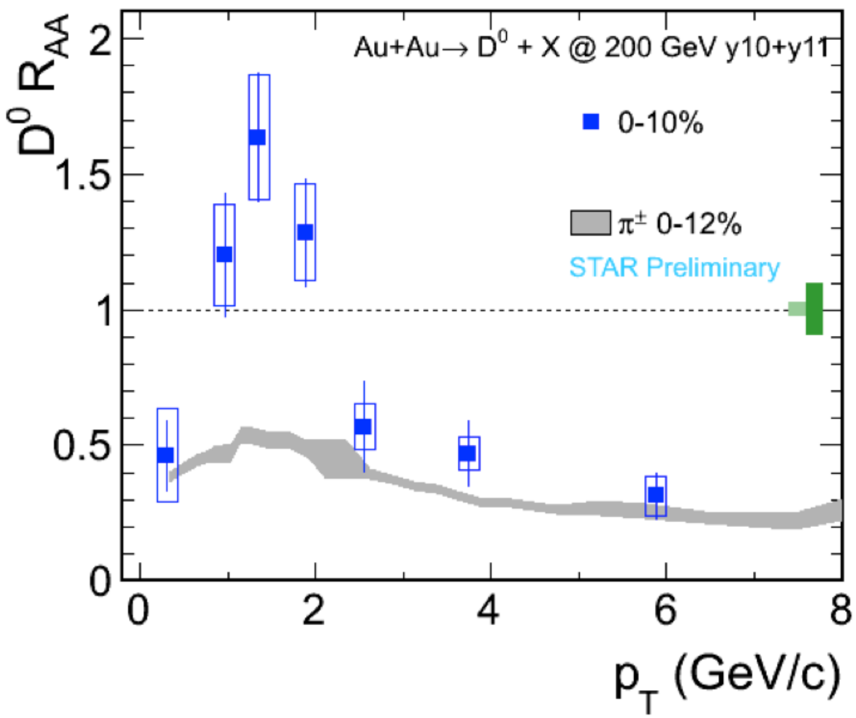
Z.Conesa (QM2012)

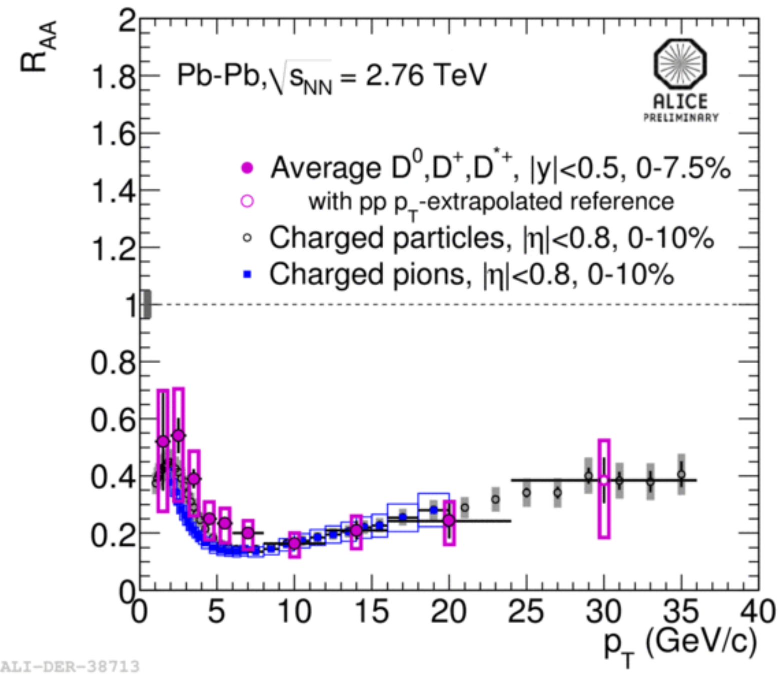
D R_{AA} at RHIC and LHC



- D R_{AA} similar at RHIC and LHC at 5-6 GeV/c
- Looks quite different at 1-2 GeV/c:
  - Could it be shadowing + recombination + radial flow? (stronger effect at RHIC because of steeper dN/dp_T)
  - A transport model (Rapp et al.) with these ingredients predicts maximum R_{AA} ~1.3 at RHIC and ~0.7 at LHC

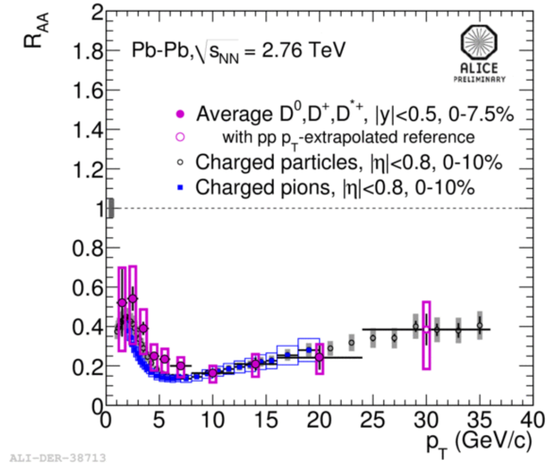
Looking for colour charge dependence: D mesons vs. pions at RHIC and LHC



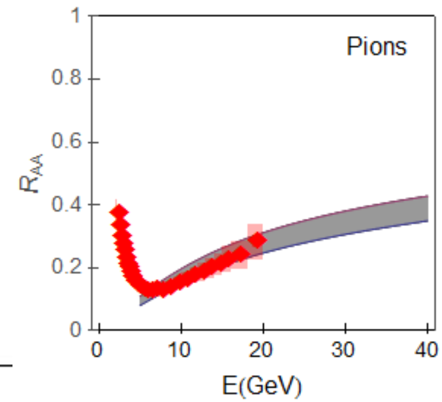


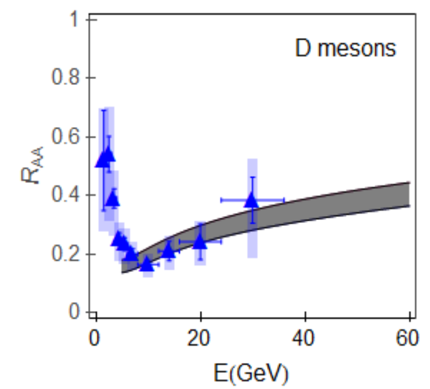
- D consistent with pions for p_T>5-6 GeV
- Hint for D > π in 2-5 GeV/c?
  - Below 2 GeV/c: no direct comparison, π not expected to scale with N_{coll}
- Is it consistent with the colour charge dependence?

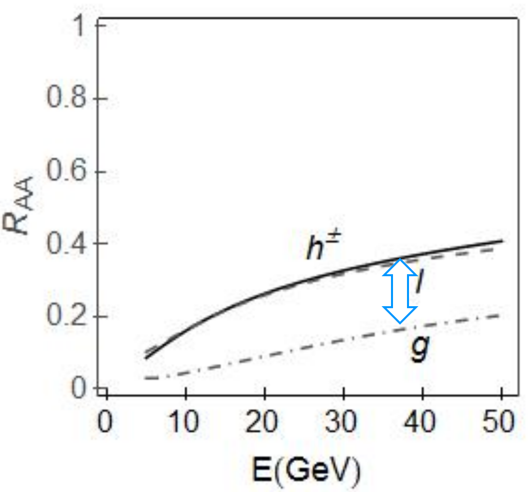
D mesons vs. pions at LHC

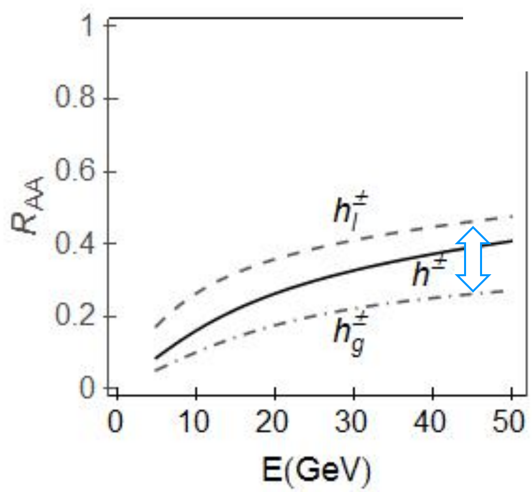


- Calculation by M. Djordjevic (rad+coll energy loss) can describe both R_{AA}
- Shows strong colour charge effect in partonic R_{AA} (g vs. light and c)









Suggests that colour charge effect helps to describe the observed $R_{AA}^{D} \sim R_{AA}^{\pi}$

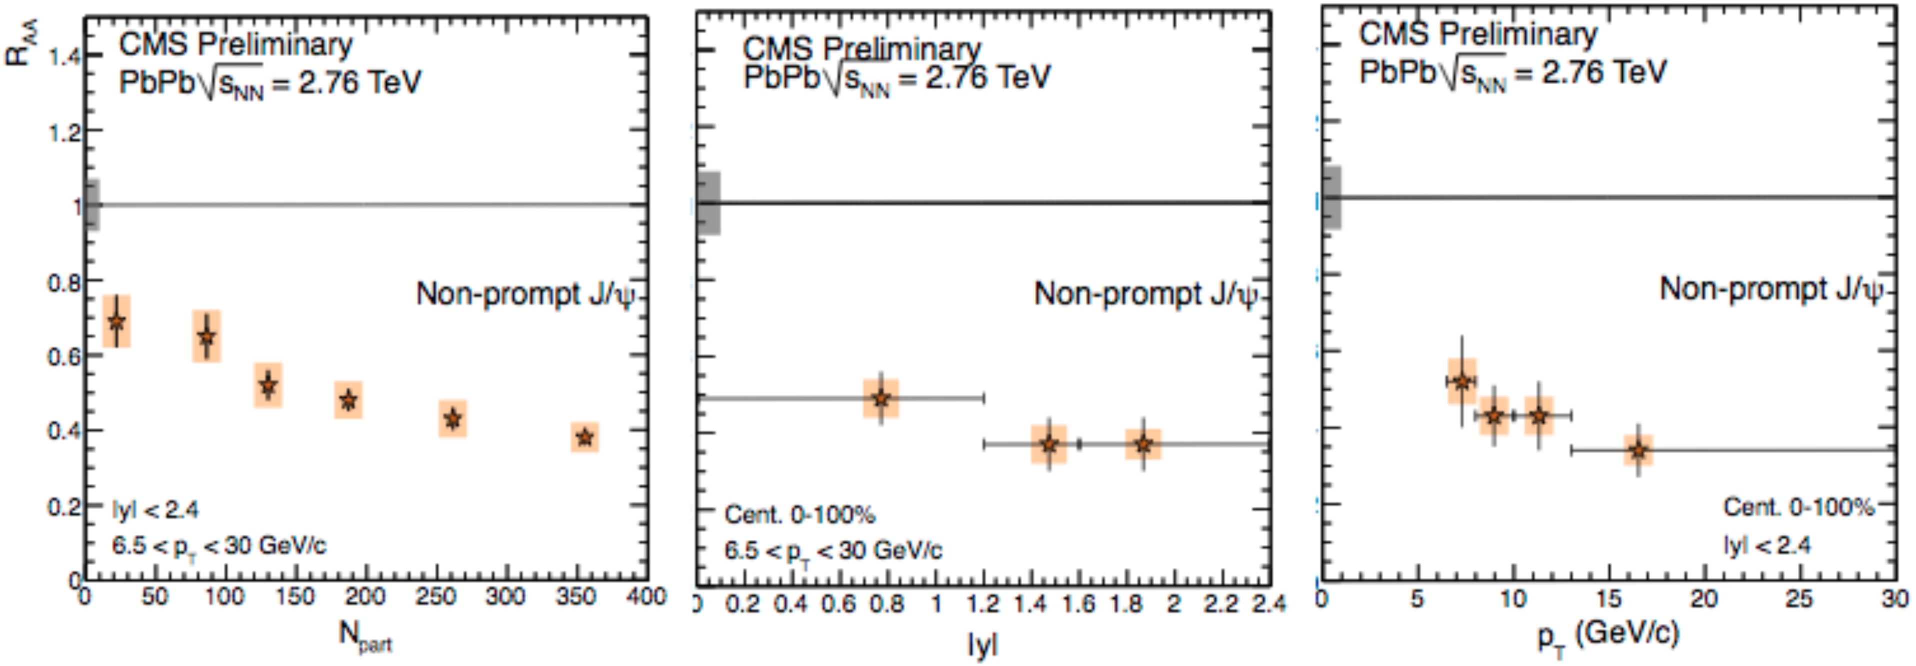
M. Djordjevic and M. Djordjevic, arXiv:1307.4098

Outline of the Talk

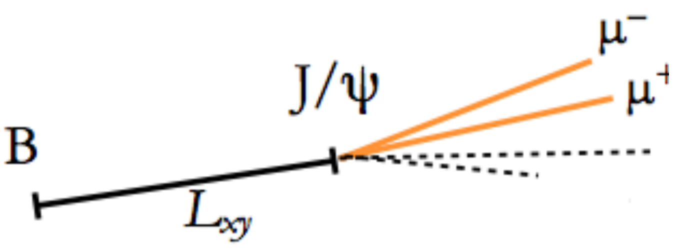
- Introduction: HF probes of the medium
- Calibrating HF probes: pp results
- HF production in nucleus-nucleus:
  - Semi-leptonic decays
  - D mesons
  - B and b-jets
- HF azimuthal anisotropy
- Proton-nucleus: control data … and more?
- Outlook: detector upgrades at RHIC and LHC

Beauty suppression at LHC

- First measurement of beauty R_{AA} by CMS (CMS-PAS-HIN-12-014)

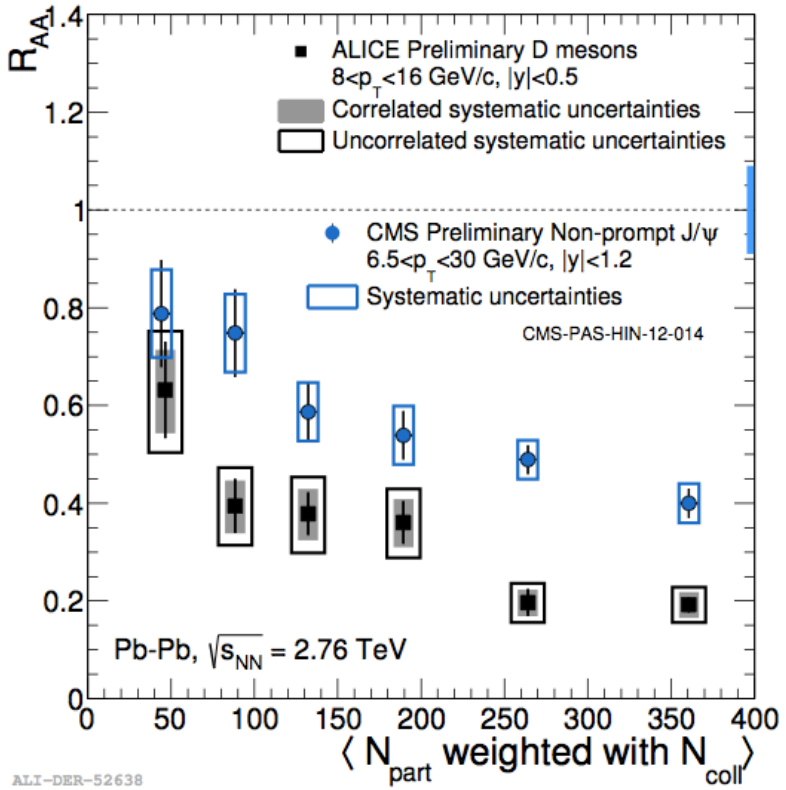


- Centrality dependence of B→J/ψ R_{AA}
  - 50-100%: factor ~1.4 → 0-5%: factor ~2.5
- Hint of less suppression at mid-rapidity
- Hint of larger suppression at higher p_T



Looking for mass dependence: R_{AA} of D and B at the LHC

- **D mesons (ALICE)** and **J/ψ from B decays (CMS)**



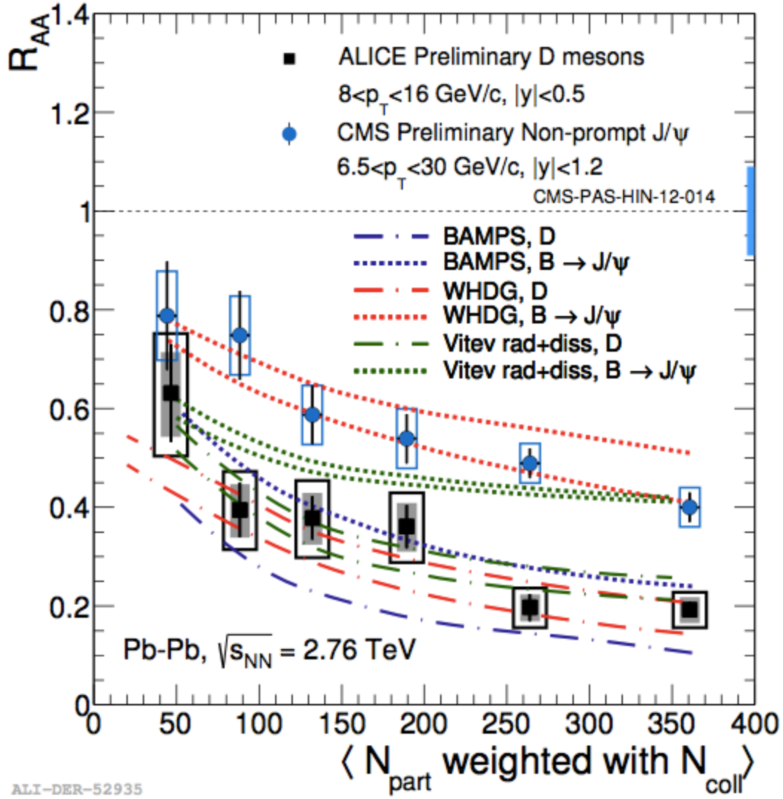
With this selection:
- **B $\langle p_T \rangle$ ~ 11 GeV**
- **D $\langle p_T \rangle$ ~ 10 GeV**

- First clear indication of a dependence on heavy quark mass:

$$R_{AA}^{B} > R_{AA}^{D}$$

Looking for mass dependence: R_{AA} of D and B at the LHC

- **D mesons (ALICE)** and **J/ψ from B decays (CMS)**



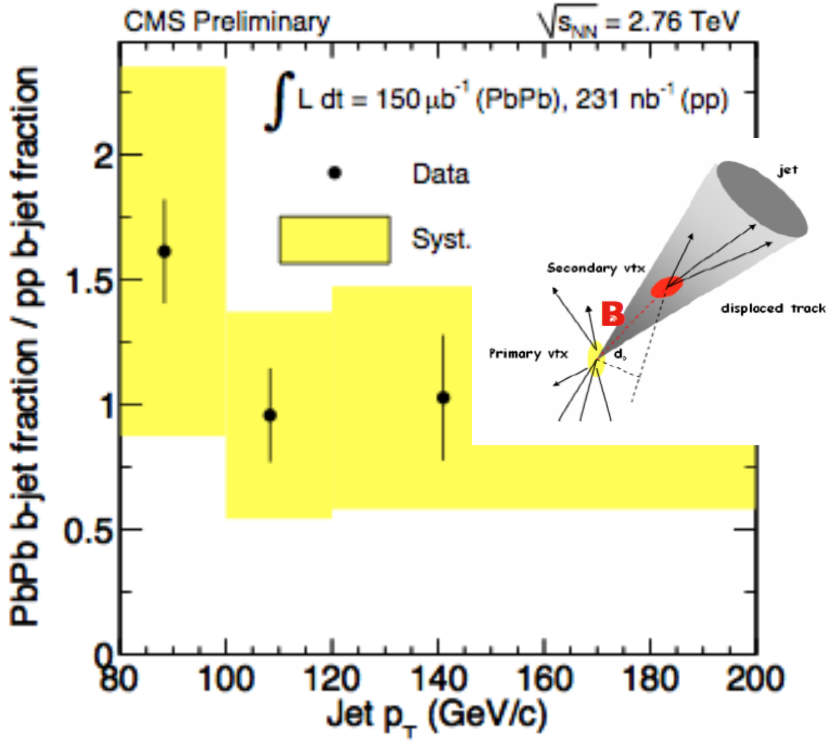
With this selection:

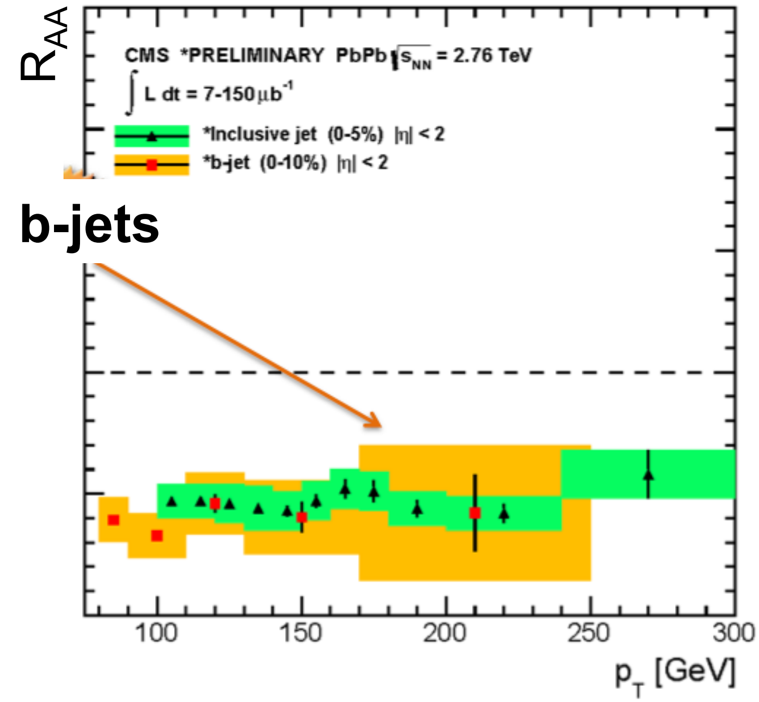
- **B $\langle p_T \rangle$ ~ 11 GeV**
- **D $\langle p_T \rangle$ ~ 10 GeV**

- First clear indication of a dependence on heavy quark mass:

$$R_{AA}^{B} > R_{AA}^{D}$$

Large b-jet suppression at LHC





b-jet double_ratio =
b-fraction in PbPb / b-fraction in pp

b-jet R_{AA} =
inclusive-jet R_{AA} * b-jet double_ratio

- CMS finds the same R_{AA} for b-jets as for q/g-jets, as expected at this p_T

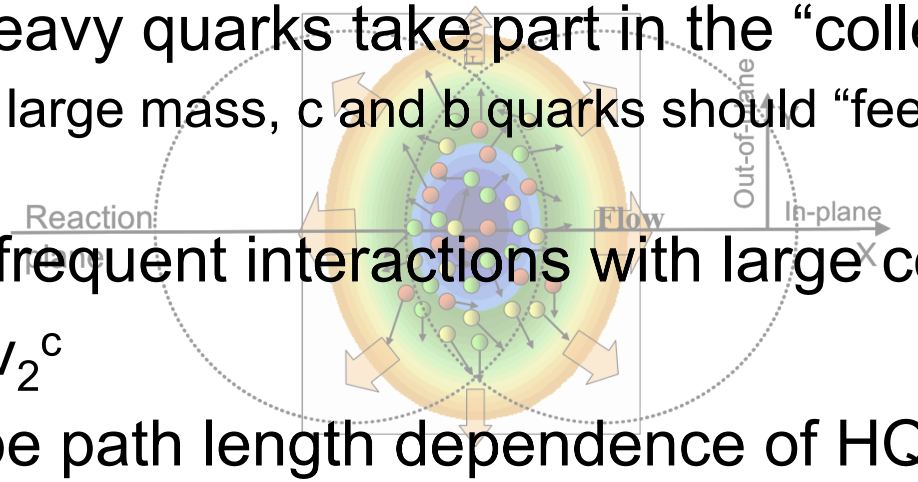
CMS-HIN-12-003

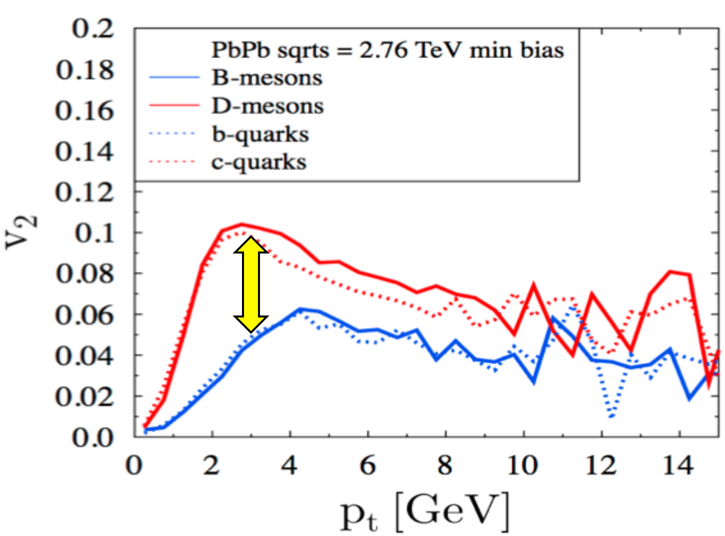
Outline of the Talk

- Introduction: HF probes of the medium
- Calibrating HF probes: pp results
- HF production in nucleus-nucleus:
  - Semi-leptonic decays
  - D mesons
  - B and b-jets
- HF azimuthal anisotropy
- Proton-nucleus: control data … and more?
- Outlook: detector upgrades at RHIC and LHC

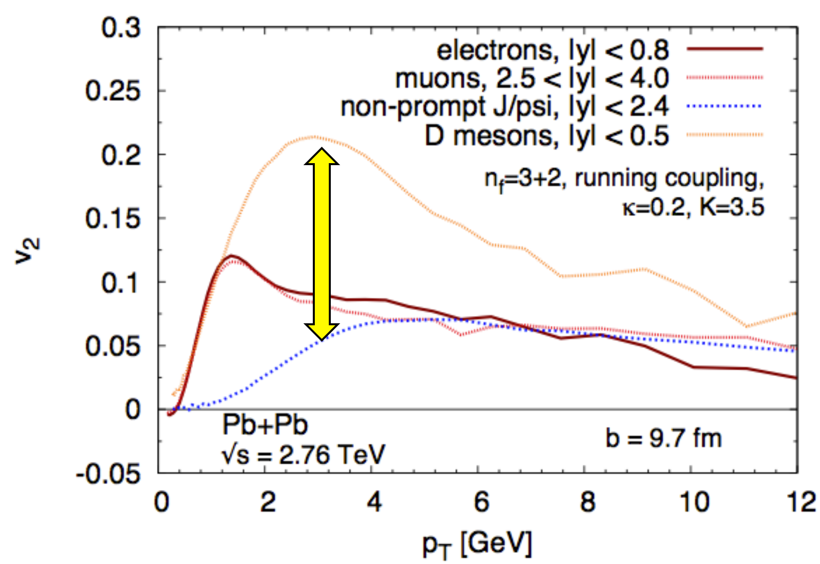
Heavy flavour v_2: a two-fold observable

- Low p_T: do heavy quarks take part in the “collectivity”?
  - Due to their large mass, c and b quarks should “feel” less the collective expansion
    - → need frequent interactions with large coupling to build v_2
    - → $v_2^b < v_2^c$
- High p_T: probe path length dependence of HQ energy loss





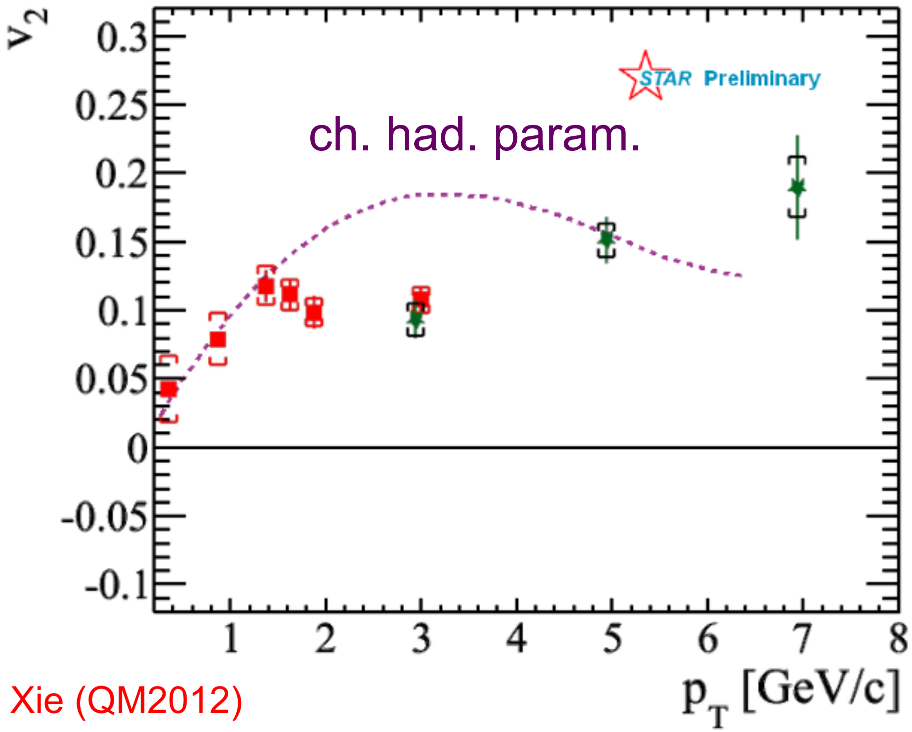
J. Aichelin et al. in arXiv:1201.4192



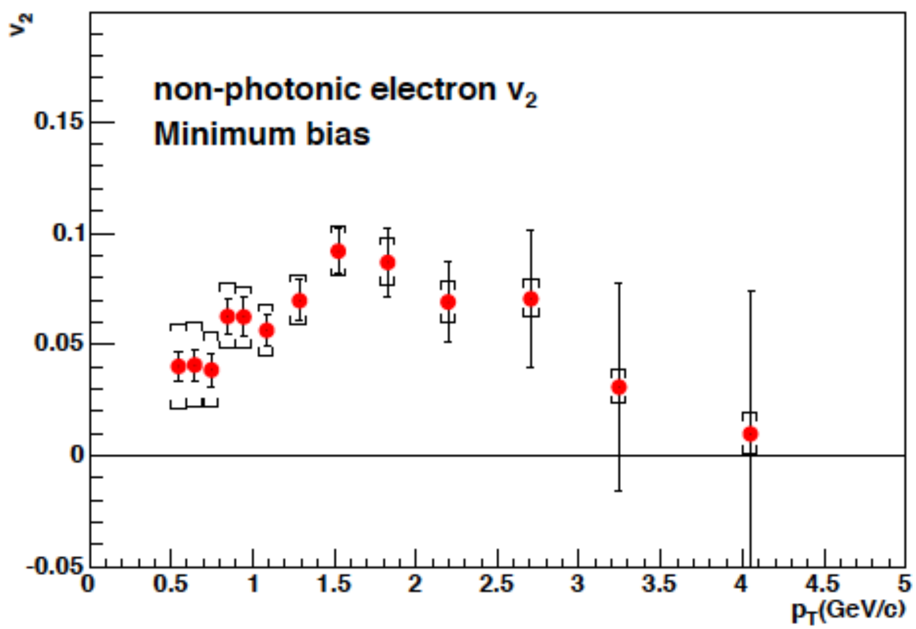
J. Uphoff et al. in arXiv:1205.4945

Heavy Flavour v_2 at RHIC

- Electrons from HF show a v_2 of up to 0.15 at RHIC (PHENIX, STAR)
  - Charm does flow!
  - v_2 significantly smaller than for pions above 2 GeV/c (might be decay kinematics, rather than a difference heavy vs. light)

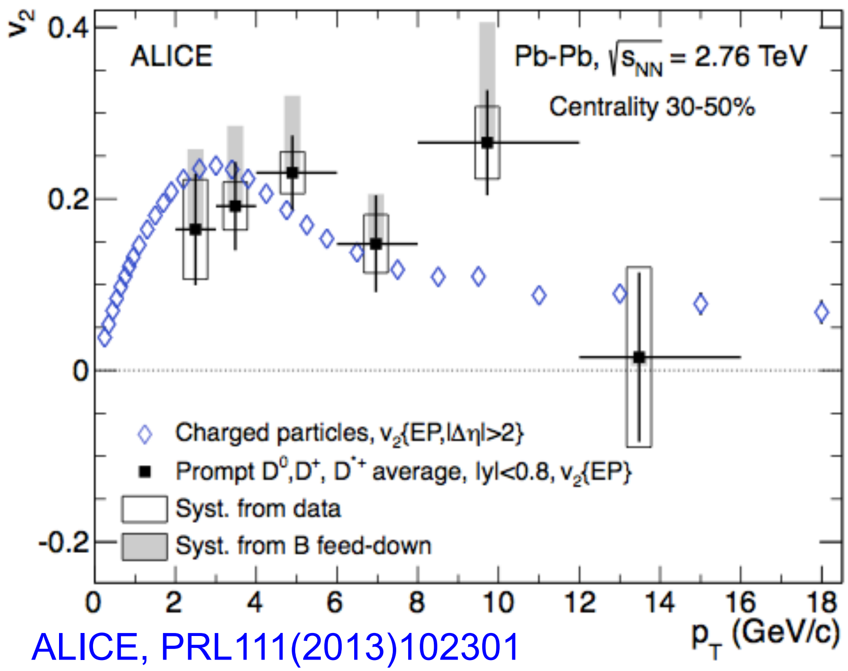


W. Xie (QM2012)

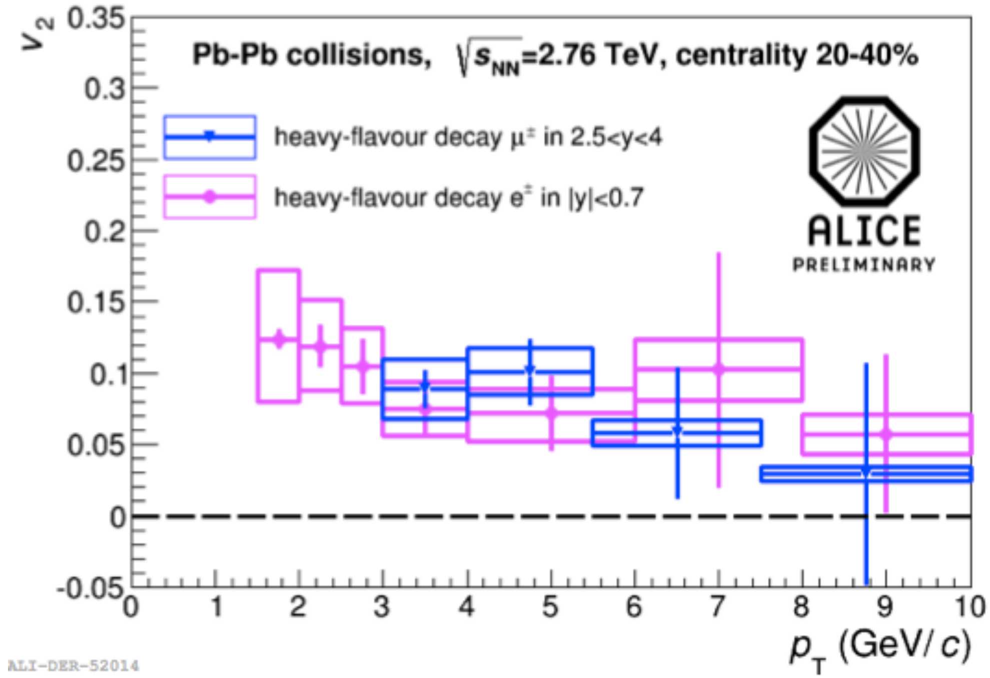


PHENIX, PRC84 (2011) 044905

Heavy Flavour v_2 at LHC

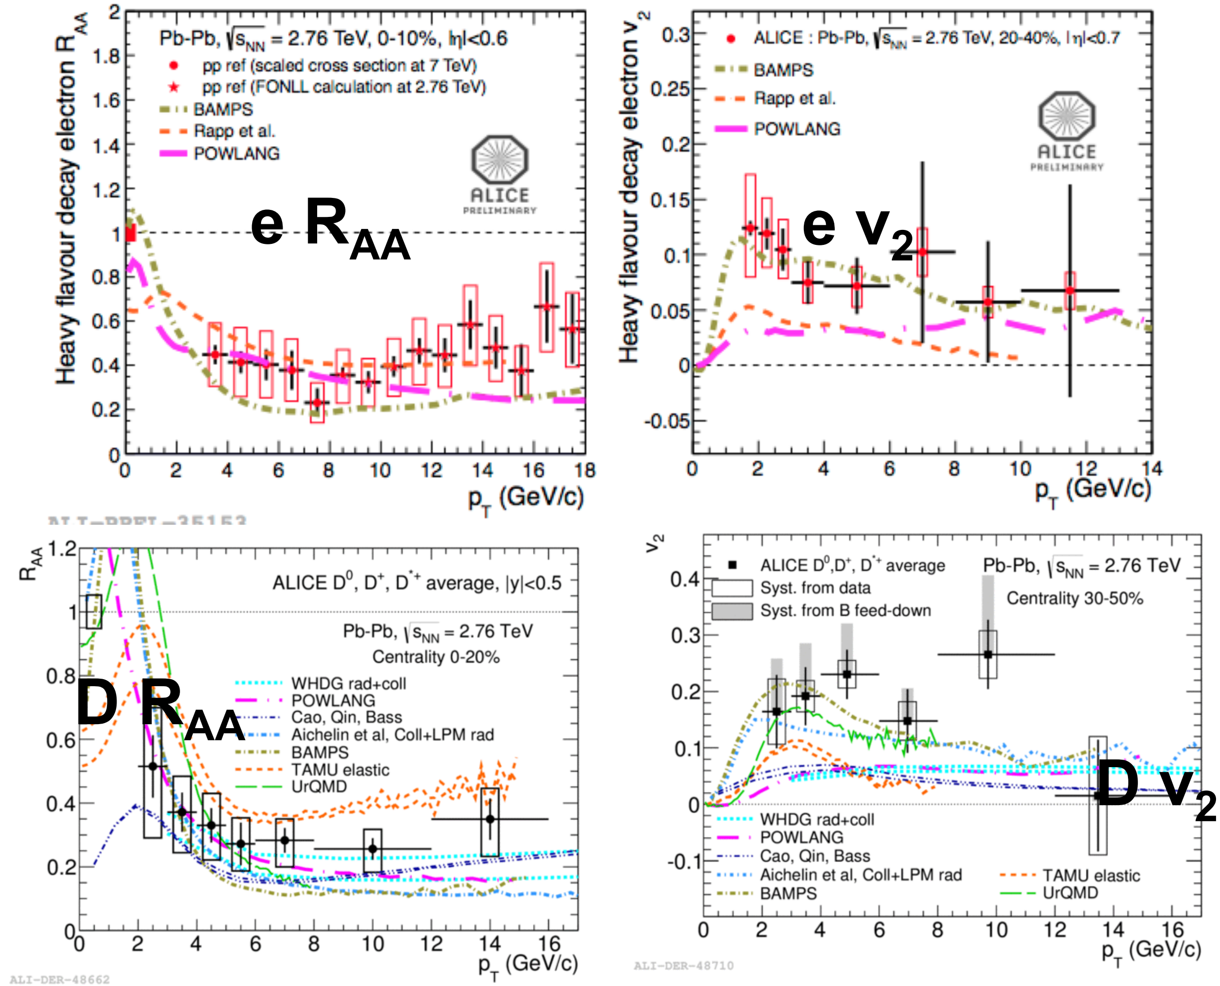


ALICE, PRL111(2013)102301



- D meson v_2 in 30-50%: ~0.2 in 2-6 GeV/c
  - Comparable with charged particle v_2
- HF-decay e (|y|<0.7) and μ (2.5<y<4) v_2 in 20-40%: >0 in 1.5-5 GeV/c
- What is the origin of this v_2? c quark flow? coalescence?
- Much more to learn with future data

LHC R_{AA} and v_2 vs. models

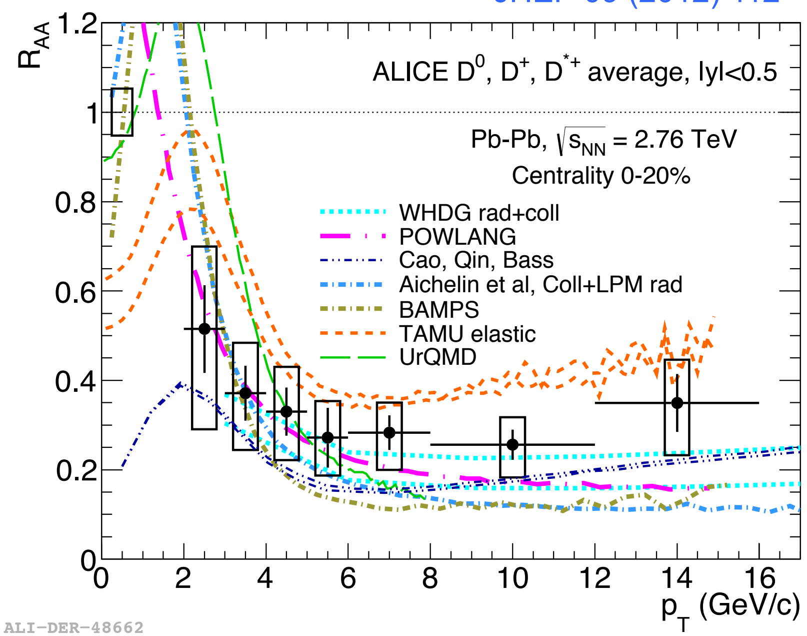


BAMPS Uphoff et al. arXiv: 1112.1559, Aichelin et al. Aichelin et al. Phys. Rev. C 79 (2009) 044906,

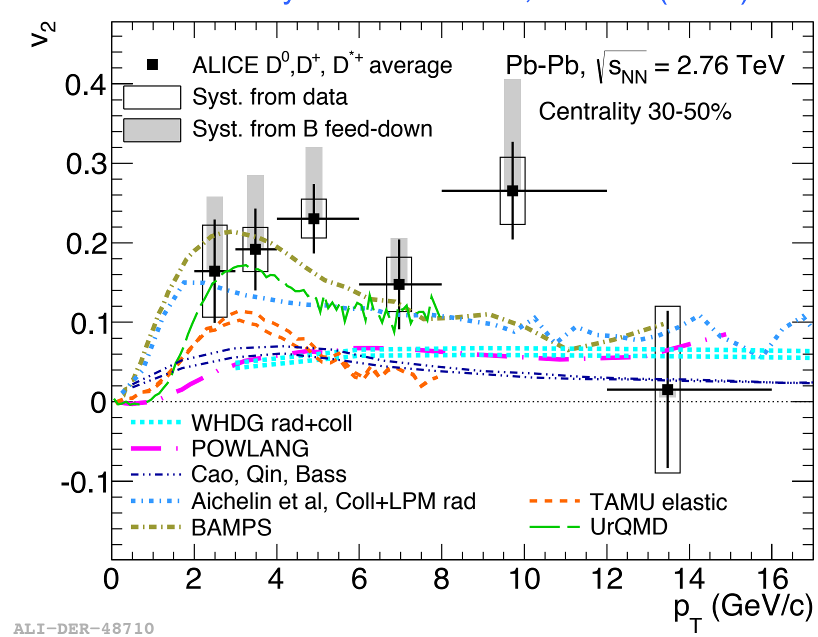
WHDG W. A. Horowitz et al. J. Phys. G38, 124064 (2011), POWLANG W. M. Alberico et al. Eur. Phyis J. C 71, 1666 (2011), TAMU M. He, R. J. Fries and R. Rapp, arXiv:1204.4442[nucl-th], UrQMD arXiv:1211.6912, J. Phys. Conf. Ser. 426, 012032 (2013), Cao, Quin, Bass arXiv:1308.0617

A closer look to D mesons

JHEP 09 (2012) 112



Phys. Rev. Lett. 111, 102301 (2013)



- All these models describe both HF-e R_{AA} and v_2 at RHIC
- Models without HQ interactions with expanding medium underestimate v_2 (WHDG, POWLANG), but are among the best for R_{AA}
- Max v_2~0.15-0.20 is better described by models that include collisional energy loss of heavy quarks in expanding medium (BAMPS, UrQMD, Aichelin et al). Some include coalescence (UrQMD, Aichelin et al)
- However, they tend to overshoot (undershoot) R_{AA} at low (high) p_T

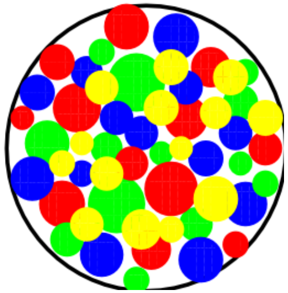
Outline of the Talk

- Introduction: HF probes of the medium
- Calibrating HF probes: pp results
- HF production in nucleus-nucleus:
  - Semi-leptonic decays
  - D mesons
  - B and b-jets
- HF azimuthal anisotropy
- Proton-nucleus: control data … and more?
- Outlook: detector upgrades at RHIC and LHC

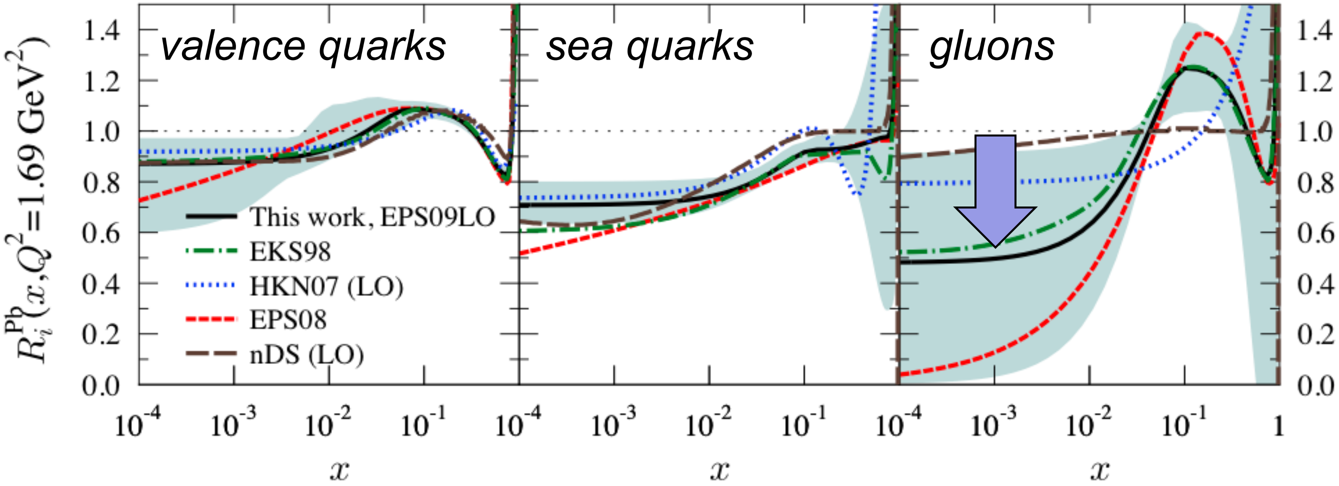
R_{AA} suppression: a QCD medium effect?

- The observed suppression can have a contribution from initial-state effects, not related to the hot QCD medium
- High parton density in high-energy nuclei leads to reduction/ saturation/shadowing of the *PDFs* at small x (and small Q^2)

$$\frac{dN^D_{PbPb}}{dp_T} = PDF(x_1)PDF(x_2) \otimes \frac{d\hat{\sigma}^c}{dp_T} \otimes P(\Delta E) \otimes D_{c\to D}(z)$$

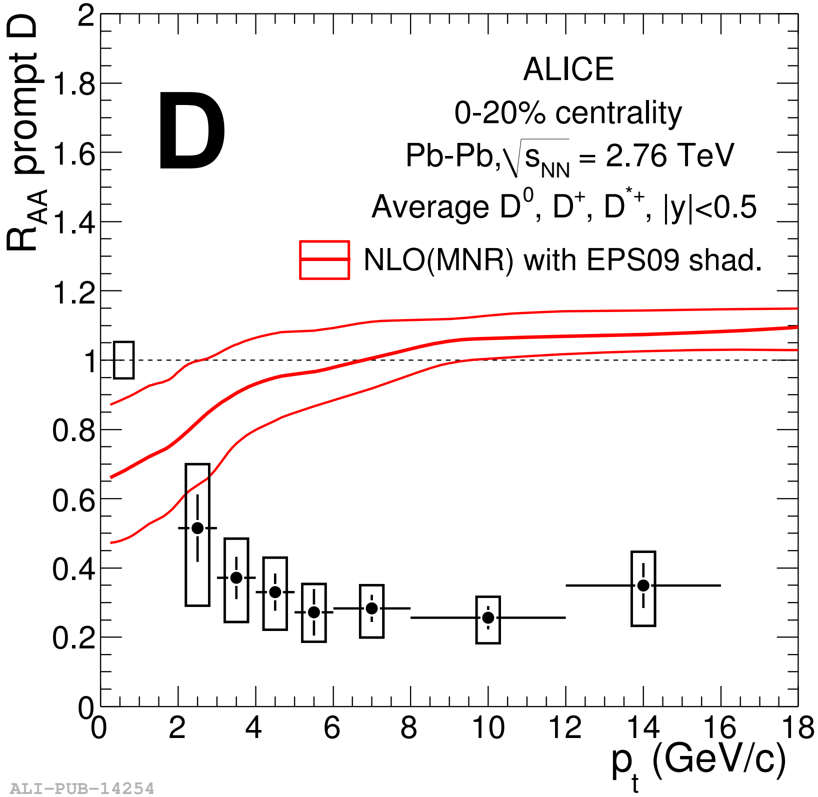


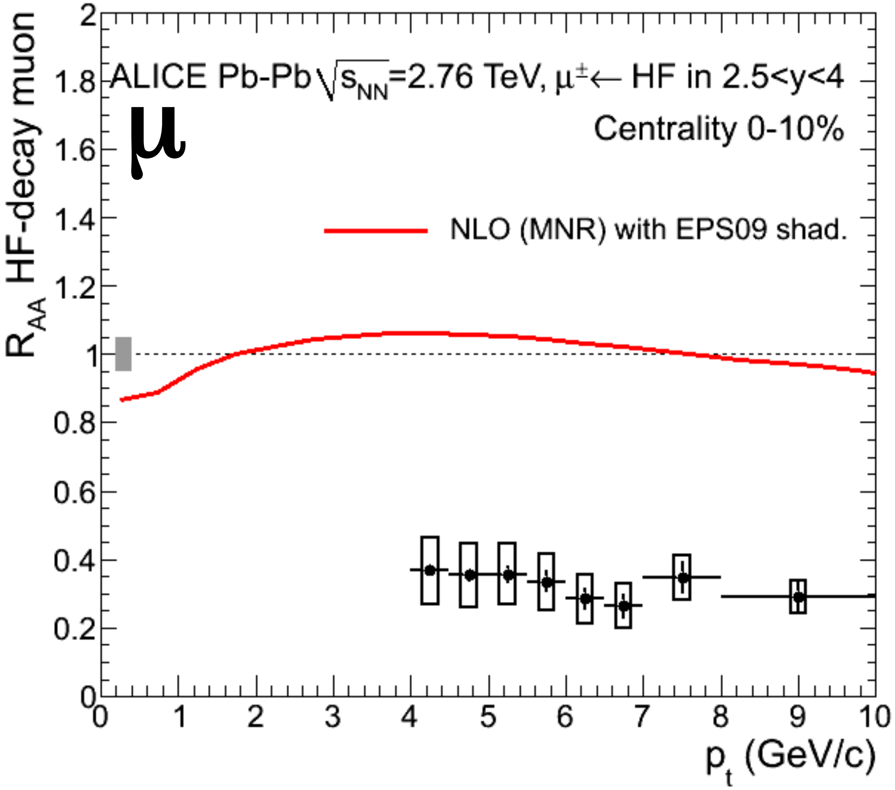
Nuclear modification of PDFs



see e.g. Eskola et al. JHEP0904(2009)065

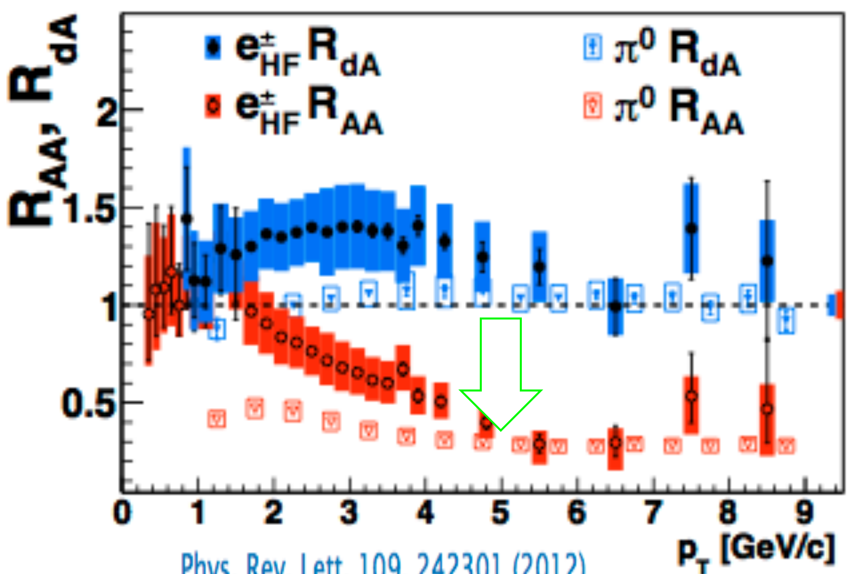
R_{AA} suppression: a QCD medium effect?



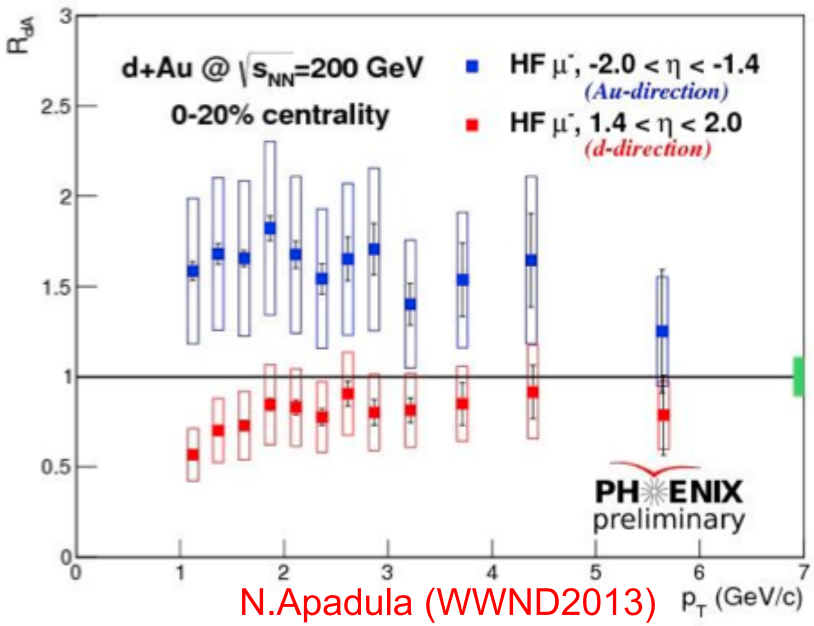


- Small effect expected from PDFs shadowing above 5 GeV/c
- Suggests that this is a hot medium effect
- pA data crucial to measure initial-state effects

HF-decay e and μ in d-Au at RHIC



Phys. Rev. Lett. 109, 242301 (2012)

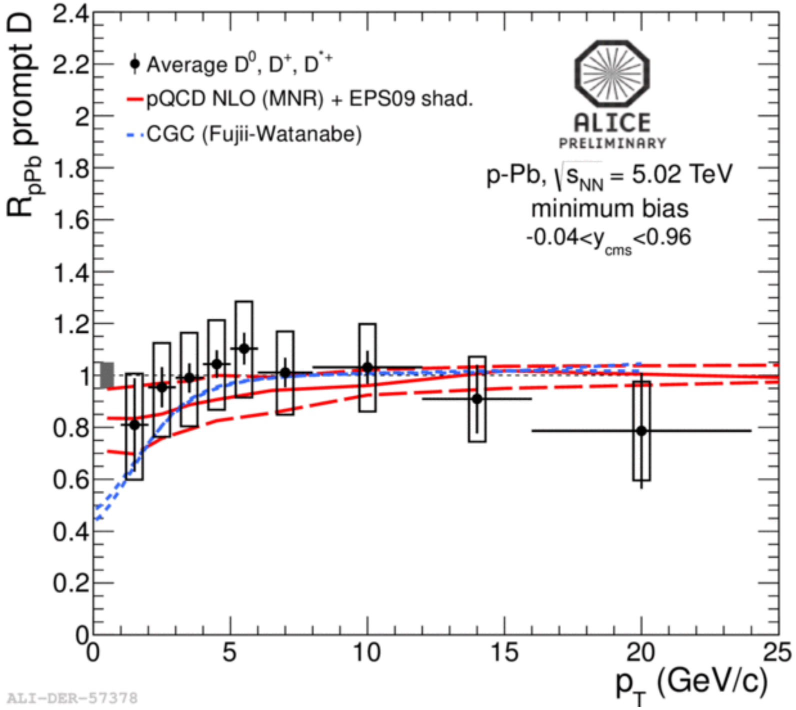


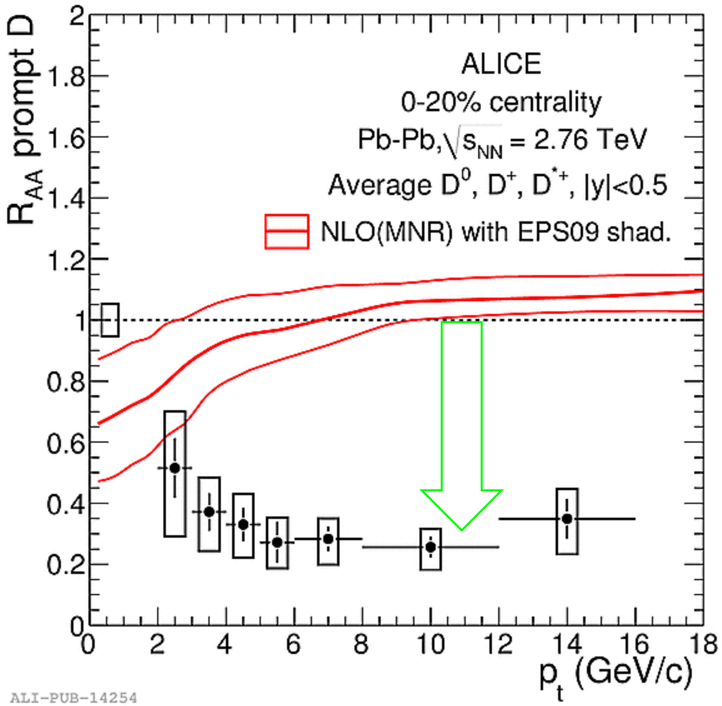
N.Apadula (WWND2013)

- Low-p_T electrons (mid-y) and muons (backward y) largely enhanced
  - More than expected from anti-shadowing?
  - Significant role of (mass-dependent?) k_T broadening?

→ Au-Au high-p_T suppression is a final state effect

D mesons in p-Pb at LHC



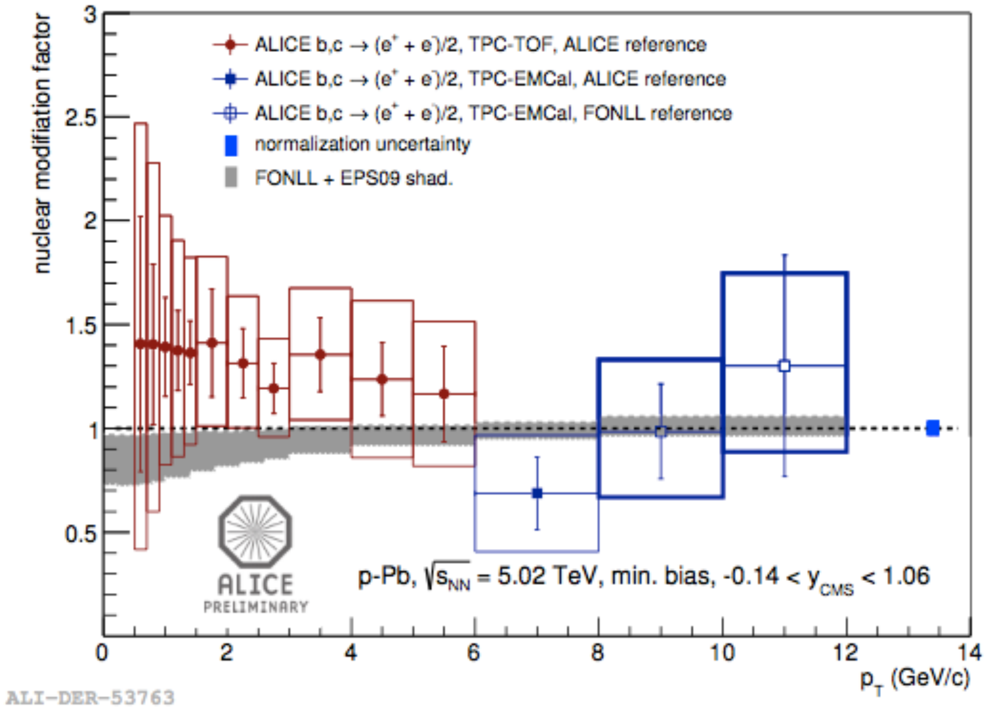


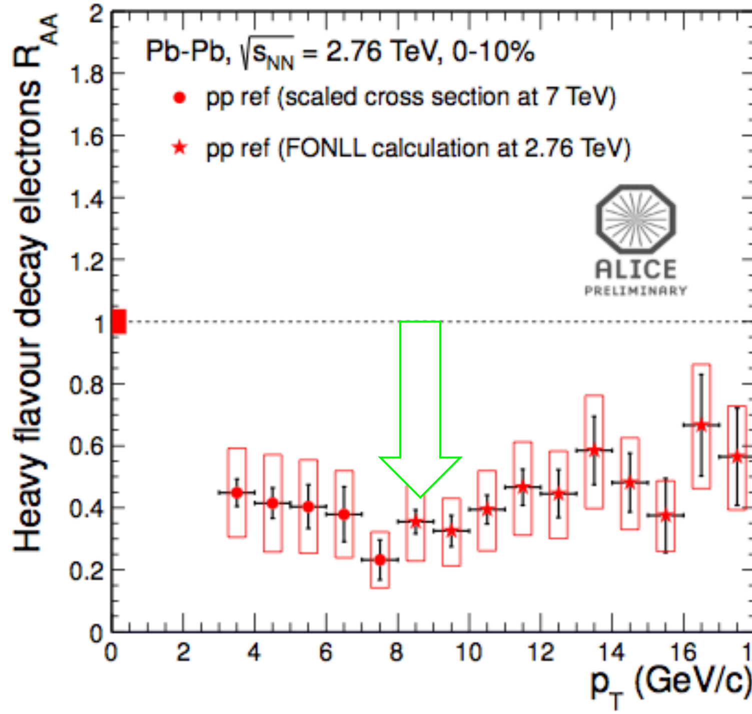
- D meson R_{pA} consistent with unity
  - Both pQCD+Shadowing (EPS09) and Colour Glass Condensate can describe the data

→ Pb-Pb high-p_T suppression is a final state effect

Eskola et al., JHEP 0904 (2009) 065 Fujii, Watanabe, priv. comm.

HF-decay electrons in p-Pb at LHC



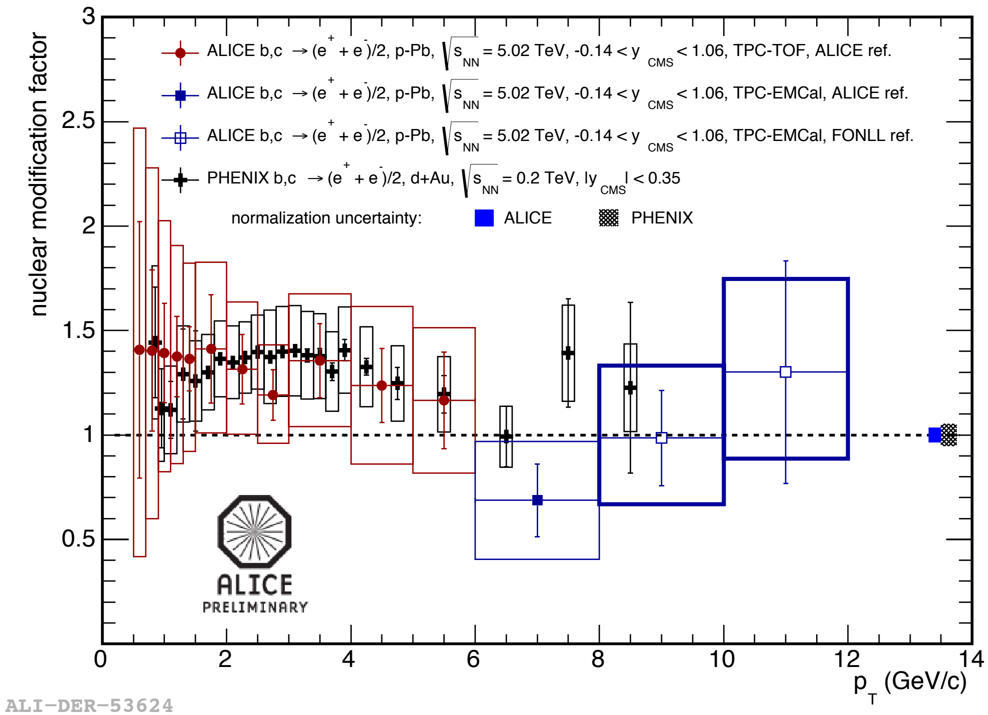


- HF-decay electron R_{pA} consistent with unity
  - pQCD+Shadowing (EPS09) can describe the data

→ Pb-Pb high-p_T suppression is a final state effect

Eskola et al., JHEP 0904 (2009) 065

HF-decay electrons in p-Pb at LHC



- HF-decay electron R_{pA} consistent with unity
  - pQCD+Shadowing (EPS09) can describe the data

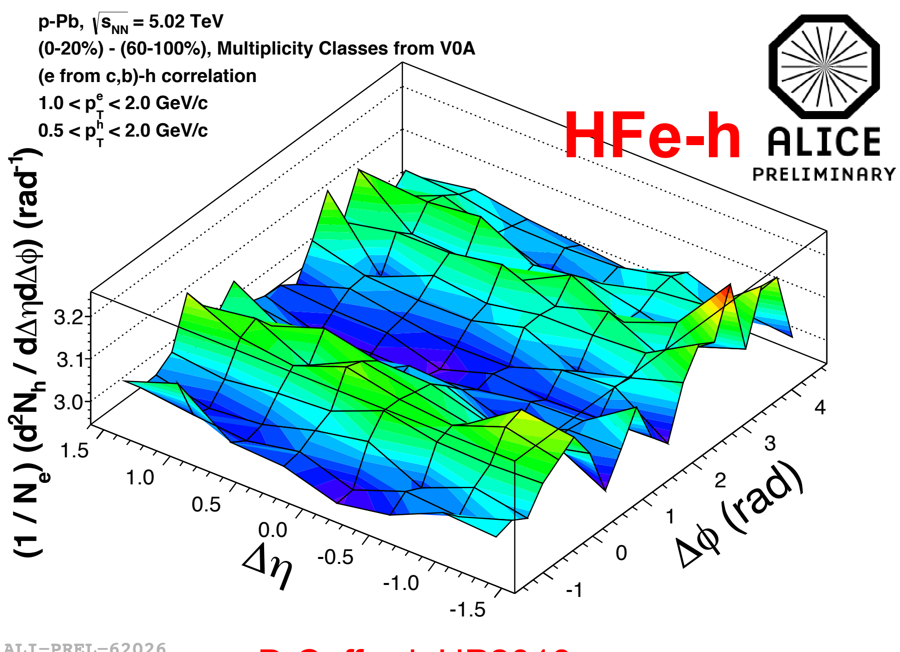
→ Pb-Pb high-p_T suppression is a final state effect

- It looks similar to PHENIX electrons, will be interesting to see the forward muon R_{pA} from ALICE

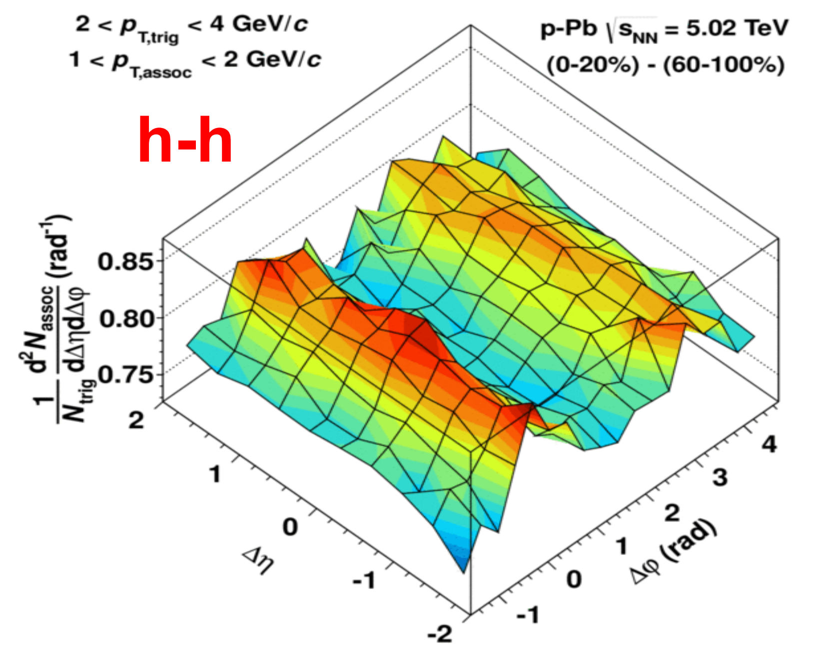
Eskola et al., JHEP 0904 (2009) 065

e-h correlations in high-mult collisions

- Correlation between HF-decay electrons and hadrons in (high-mult) – (low-mult) p-Pb collisions: a “double ridge” similar to what observed for hadron-hadron



D.Caffarri, HP2013



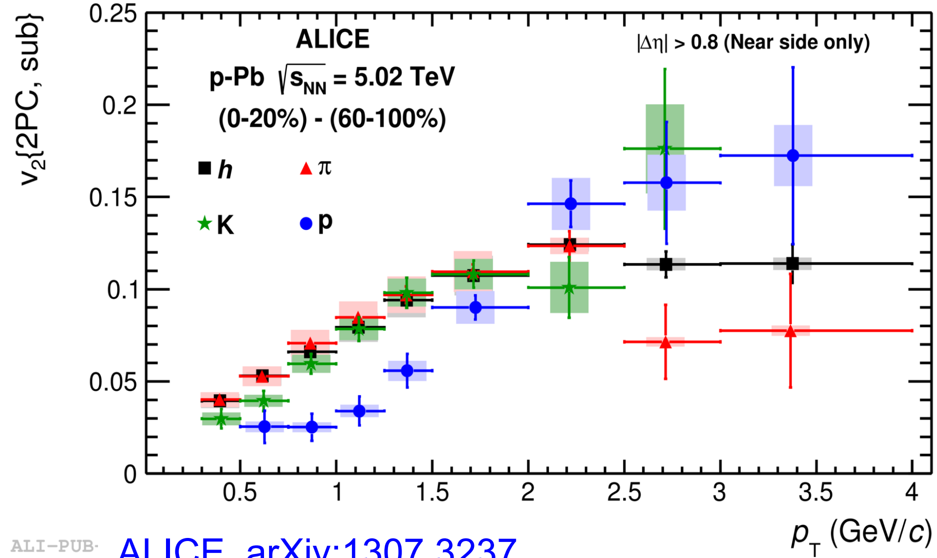
ALICE, PLB719 (2013) 29

- Resembles the structure that in AA is interpreted in terms of collective flow

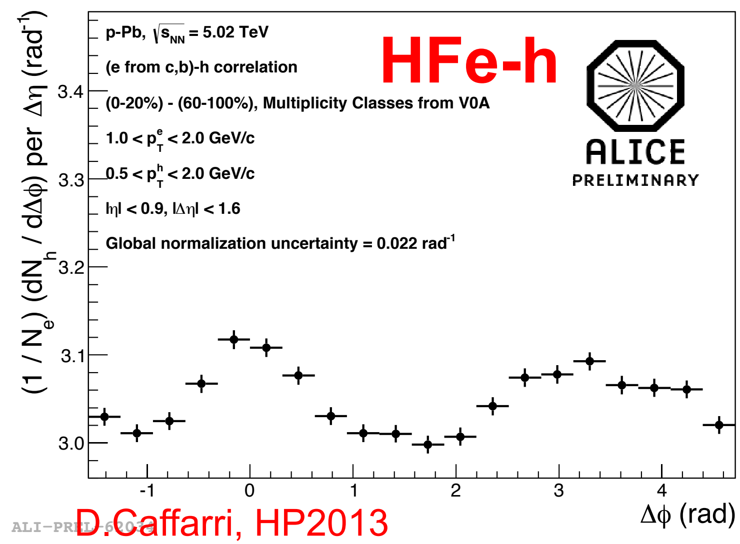
p-Pb at LHC: more than a control experiment?

e-h correlations in high-mult collisions

- For hadrons, a flow-like mass ordering is observed
- Alternative interpretations include initial-state effects (Color Glass Condensate) and "vacuum QCD" effects (color reconnection of strings)
- Heavy flavour can provide important additional information



ALICE, arXiv:1307.3237



D.Caffarri, HP2013

ALICE Upgrade Physics Motivation

Three main physics topics that are unique of the upgraded ALICE detector:

1. **Heavy-flavour transport parameters in the QGP**
   - Heavy-quark diffusion coefficient (→ QGP equation of state, viscosity of the QGP fluid), via precise HQ v_2
   - Heavy-quark thermalization and hadronization in the QGP, via v_2 and baryons
   - Mass dependence of parton energy loss in QGP medium
2. **Low-mass dielectrons: thermal photons and vector mesons from the QGP**
   - Photons from the QGP ($\gamma \rightarrow e^+e^-$) → map temperature during system evolution
   - Modification of ρ spectral function ($\rho \rightarrow e^+e^-$) → chiral symmetry restoration
3. **Charmonia (J/ψ and ψ') down to zero p_T**
   - Only the comparison of the two states can shed light on the suppression/regeneration mechanism
   - Study QGP-density dependence with measurements at central and forward rapidity

ALICE Upgrade LOI, CERN-LHCC-2012-012

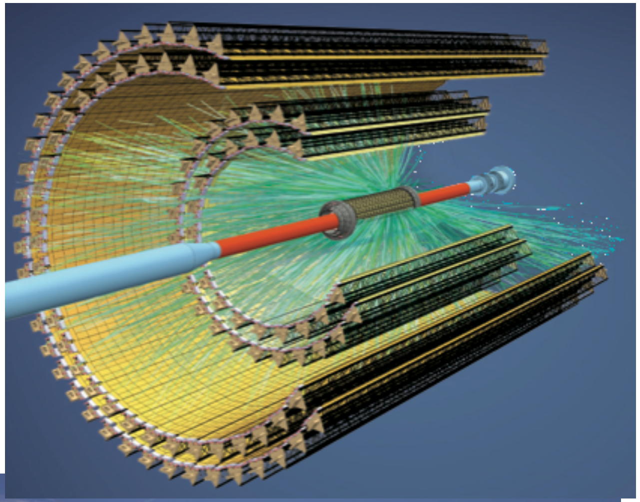
ALICE Upgrade strategy (2018)

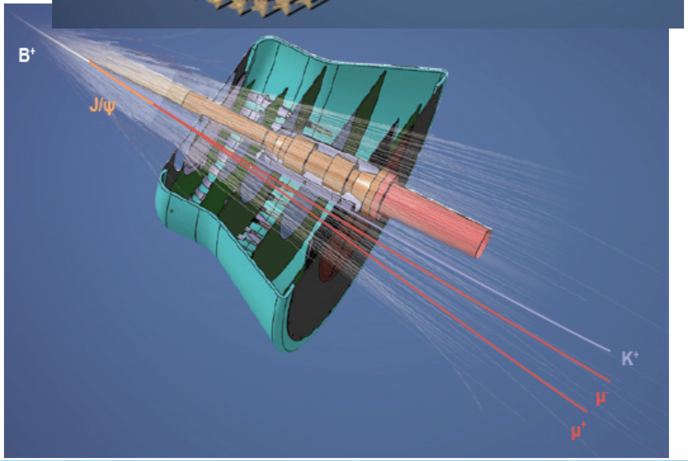
- ***Requirements:***
  1. High tracking precision at low p_T
  2. High-rate capability to exploit envisaged Pb luminosity increase of LHC

⇨ **New Inner Tracking System**
- Improve precision x3 ($r\phi$), x6 (z)

⇨ **New Muon Forward Tracker**
- Separation of displaced (di)muons from B

⇨ **New read-out for TPC (MWPC→GEM), …**
Upgraded DAQ/HLT/Offline
- Record Pb data at 50 kHz (currently <0.5 kHz)
- Integrate L_{int}=10 nb^{-1} after LS2 (~10^{11} minimum-bias Pb-Pb events)





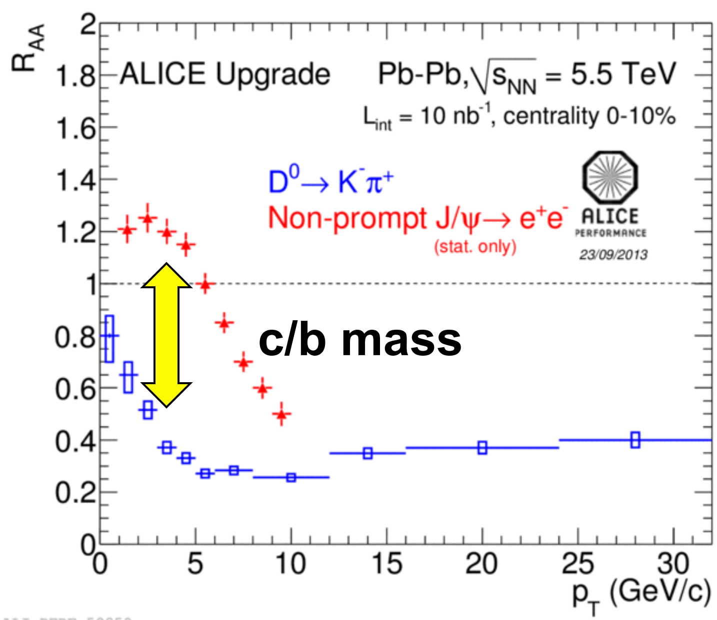
CERN-LHCC-2012-012, CERN-LHCC-2012-013, CERN-LHCC-2013-014, CERN-LHCC-2013-024

ALICE Upgrade: HF suppression and flow

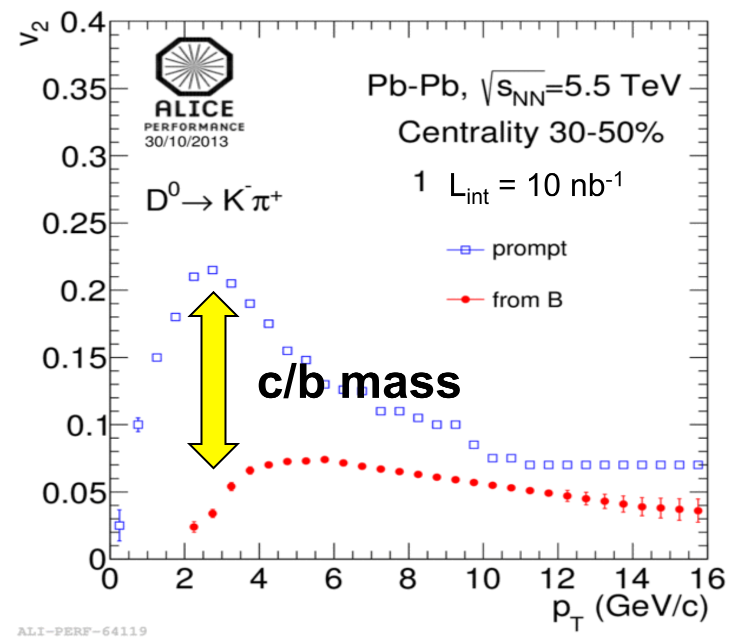
- Pin down mass dependence of energy loss
- Investigate transport of heavy quarks in the QGP
  - Sensitive to medium viscosity and equation of state

➡ R_{AA} and v_2 of D and B in a wide p_T range

Prompt D^0 and Non-prompt J/ψ R_{AA}



Prompt and non-prompt D^0 v_2



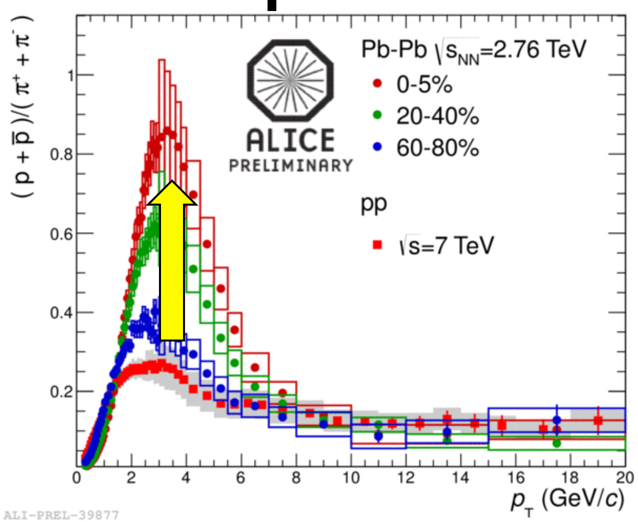
Input values from BAMPS model:
C. Greiner et al. arXiv:1205.4945

ALICE, CERN-LHCC-2013-024

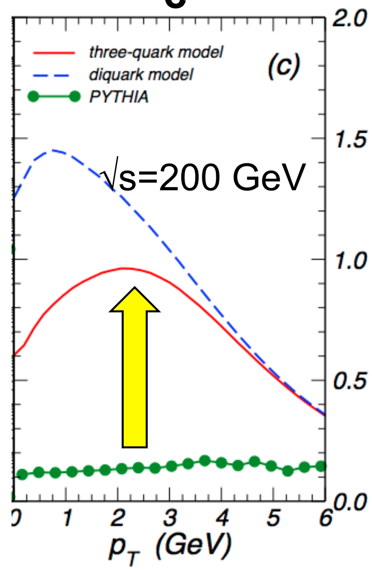
Heavy flavour in-medium hadronization?

- Baryon/meson enhancement and strange-enh. → most direct indication of light-quark hadronization in a partonic system
  - ➡ Measure this in the HF sector! Does it hold for charm?
  - ➡ Charm baryons (Λ_c) and charm-strange mesons (D_s)

p/π

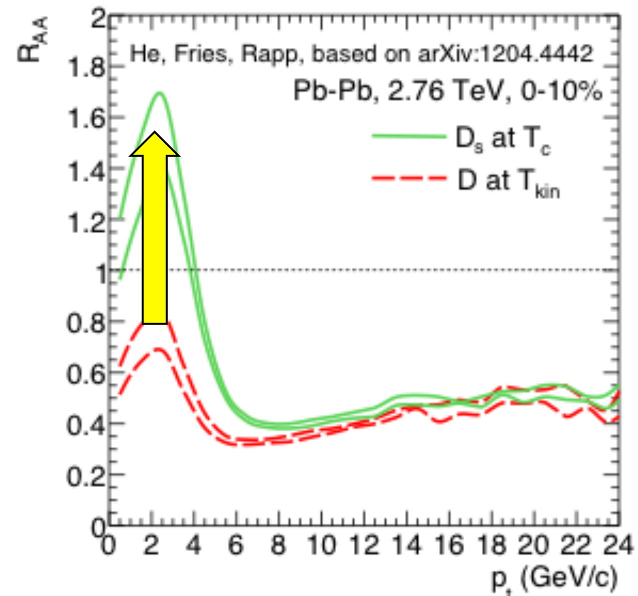


Λ_c/D



Ko et al. PRC79

D_s vs D

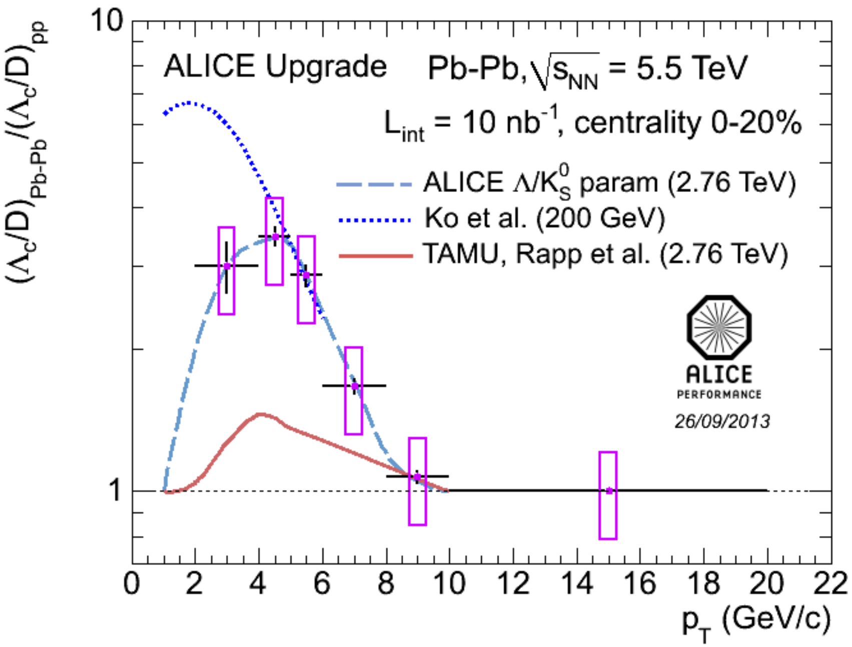


Rapp et al. arXiv:1204.4442

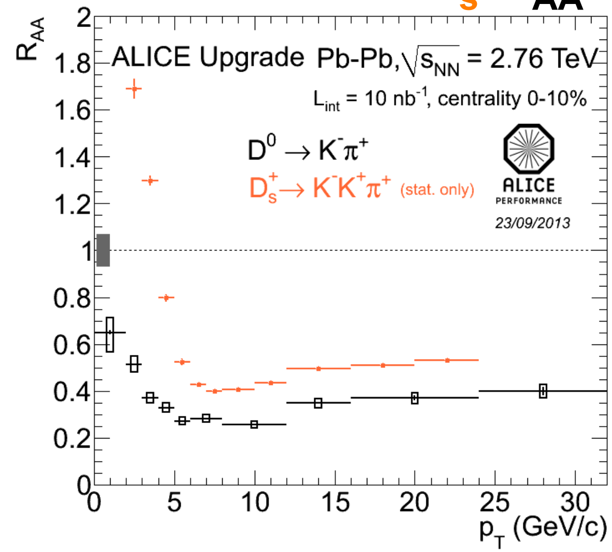
ALICE Upgrade: HF "hadrochemistry"

- $\Lambda_c \rightarrow pK\pi$ and $D_s \rightarrow KK\pi$ ($c\tau$=60 and 150 μm) measured with good precision in ALICE with upgrades and 10/nb

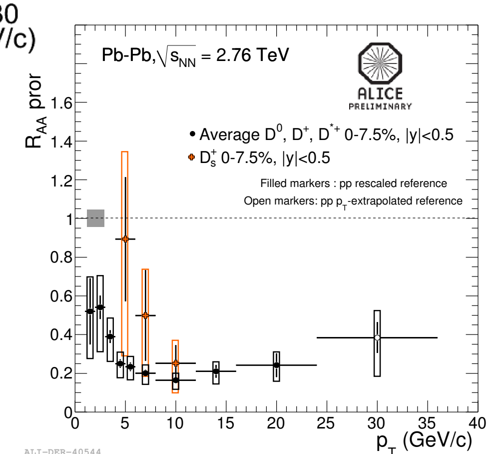
Λ_c/D enhancement
(full detector sim.)



D^0 and D_s R_{AA}



2011 data



ALICE, CERN-LHCC-2013-024

ALICE Upgrade: HF physics reach

Observable	$p_{\rm T}^{\rm min}$ (GeV/c)	statistical uncertainty
	Heavy Flavour	(at 2 GeV/c)
D meson $R_{\rm AA}$	0	0.3 %
$\rm D_s$ meson $R_{\rm AA}$	< 2	3 %
D meson from B decays $R_{\rm AA}$	2	2 %
J/ψ from B $R_{\rm AA}$	1	5 %
$\rm B^+$ yield	3	10 % (> 3 GeV/c)
$\Lambda_{\rm c}$ $R_{\rm AA}$	2	15 %
Charm baryon-to-meson ratio	2	15 %
$\Lambda_{\rm b}$ yield	7	20 % (7–10 GeV/c)
D meson elliptic flow ($v_2 = 0.2$)	0	3 %
$\rm D_s$ meson elliptic flow ($v_2 = 0.2$)	< 2	8 %
D from B elliptic flow ($v_2 = 0.1$)	2	20 %
J/ψ from B elliptic flow ($v_2 = 0.1$)	1	30 %
$\Lambda_{\rm c}$ elliptic flow ($v_2 = 0.15$)	3	20 % (3–6 GeV/c)

ALICE, CERN-LHCC-2013-024

Conclusions (I)

- From the experimental point of view, we have just entered the “golden age” for heavy-flavour observables in HI collisions
  - Thanks to the LHC detectors and RHIC upgrades

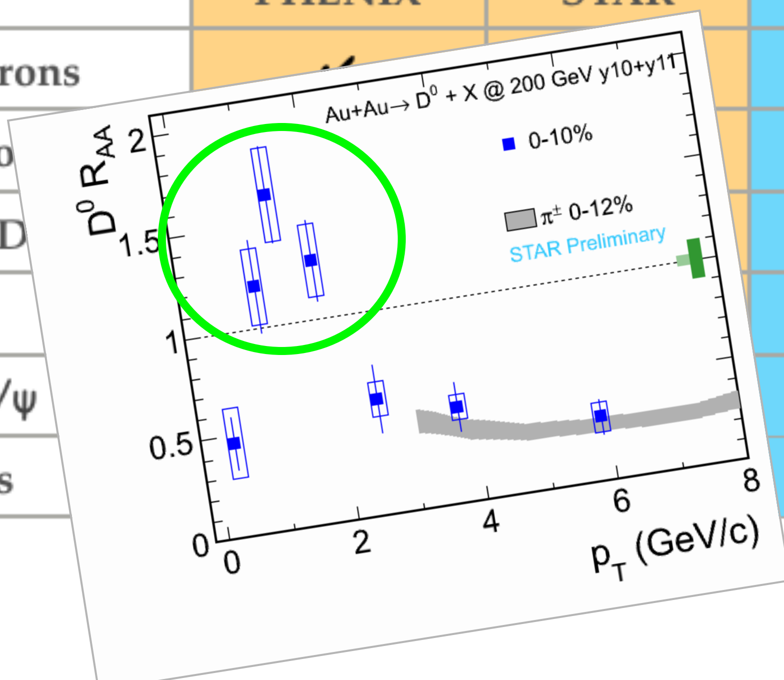
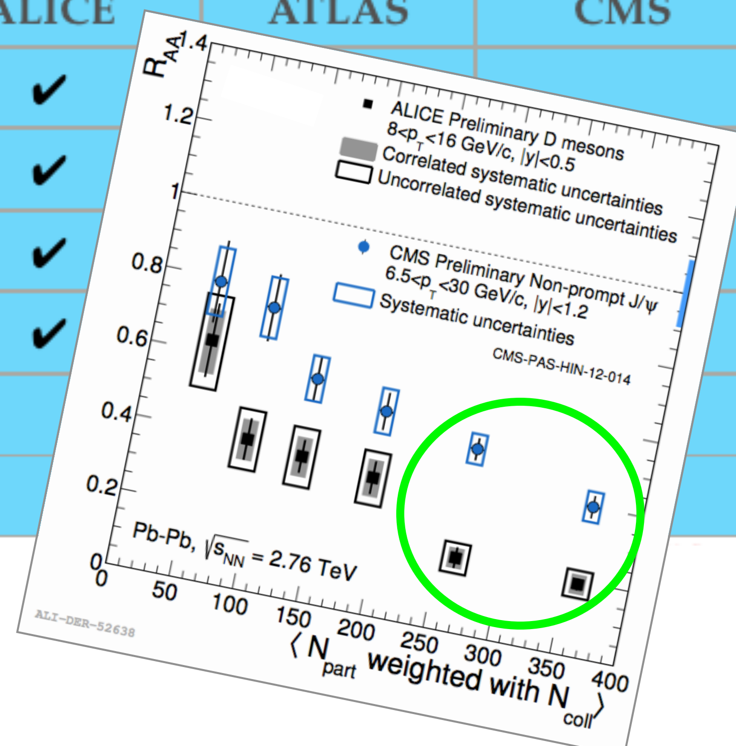
B jets						





Conclusions (2)

- From the experimental point of view, we have just entered the "golden age" for heavy-flavour observables in HI collisions
  - Thanks to the LHC detectors and RHIC upgrades

Whom and What (in p(d)A, as of today)

	PHENIX	STAR	ALICE	ATLAS	CMS	LHCb
HF electrons	✔		✔			
HF muons	✔					
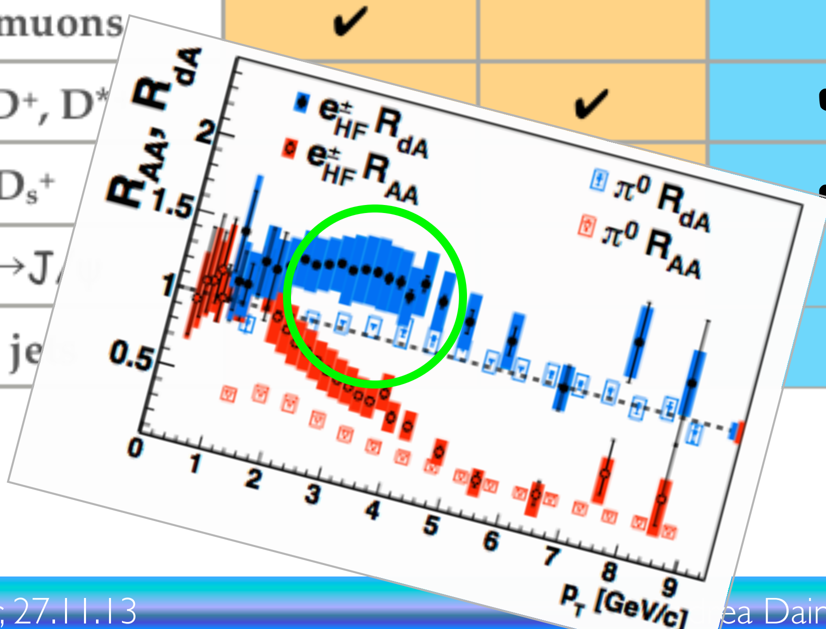
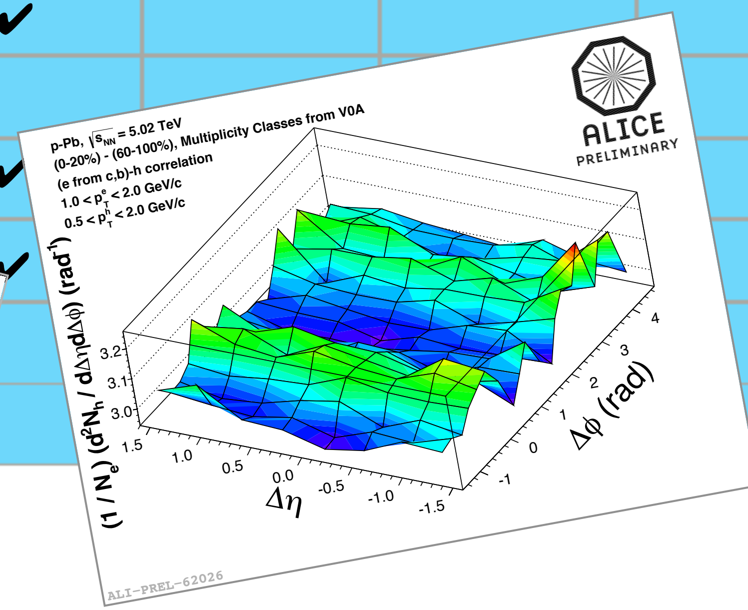
D^0, D^+, D^*		✔	✔			
D_s^+			✔			
B→J/…						✔
B je…						





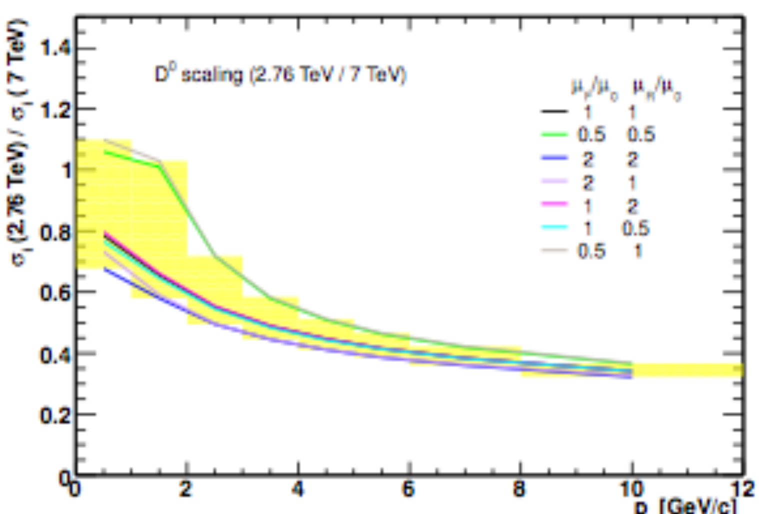
Thank You !

EXTRA SLIDES

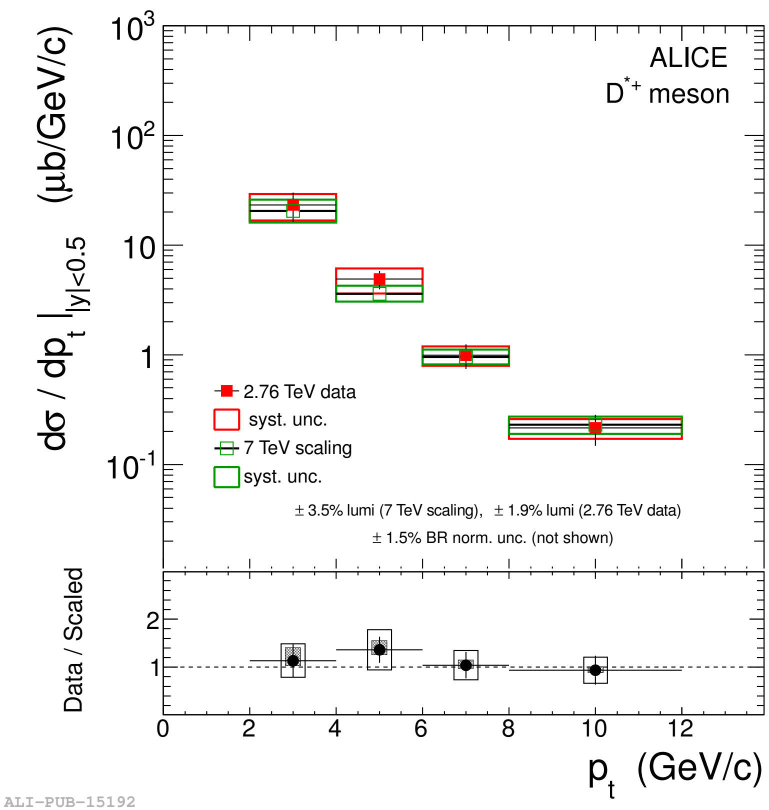
pp reference at 2.76 TeV via $\sqrt{s}$-scaling (ALICE D mesons and electrons)

- Scale the 7 TeV cross sections by the 2.76/7 factor from FONLL, with full theoretical uncertainty
  - relative scaling uncertainty: 30% → 5% in the p_t range 2 → 16 GeV/c
- Validated by comparing to measured cross section at 2.76 TeV (fewer p_t bins)

$$R_{AA}(p_t) = \frac{1}{\langle T_{AA} \rangle} \frac{dN_{AA}/dp_t}{d\sigma_{pp}/dp_t}$$



Averbeck et al., arXiv:1107.3243

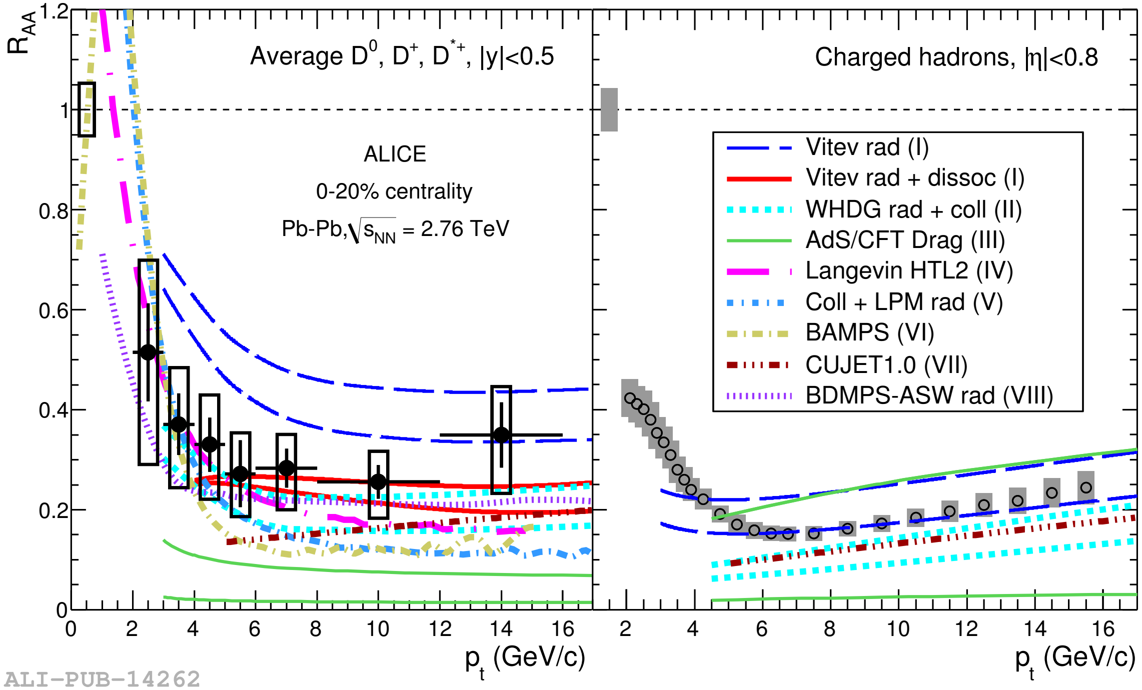


JHEP1207 (2012) 191

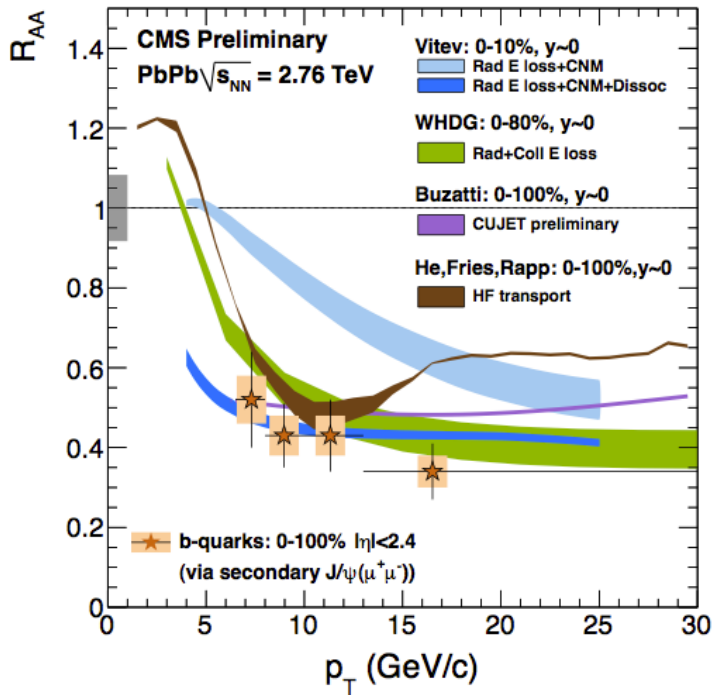
LHC: comparison with models (R_{AA})

- Several models based on E-loss and heavy-quark transport describe qualitatively the measured light, charm, and beauty R_{AA}

charm | **"light"** | **beauty**



ALICE, JHEP 09 (2012) 112

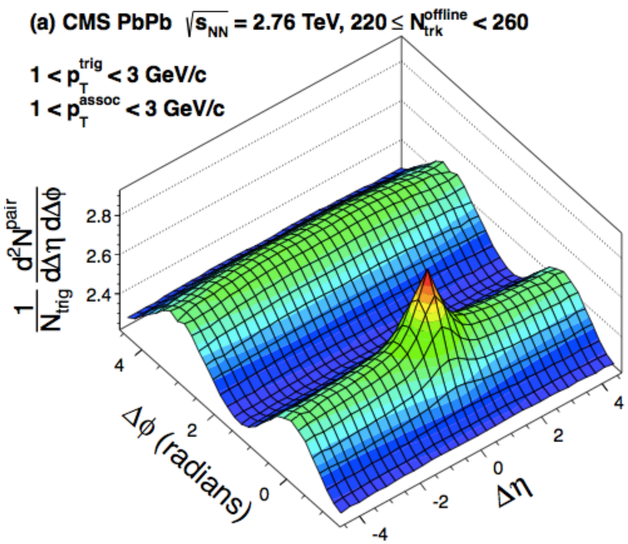


CMS-PAS-HIN-12-014

High-multiplicity pp and p-Pb collisions

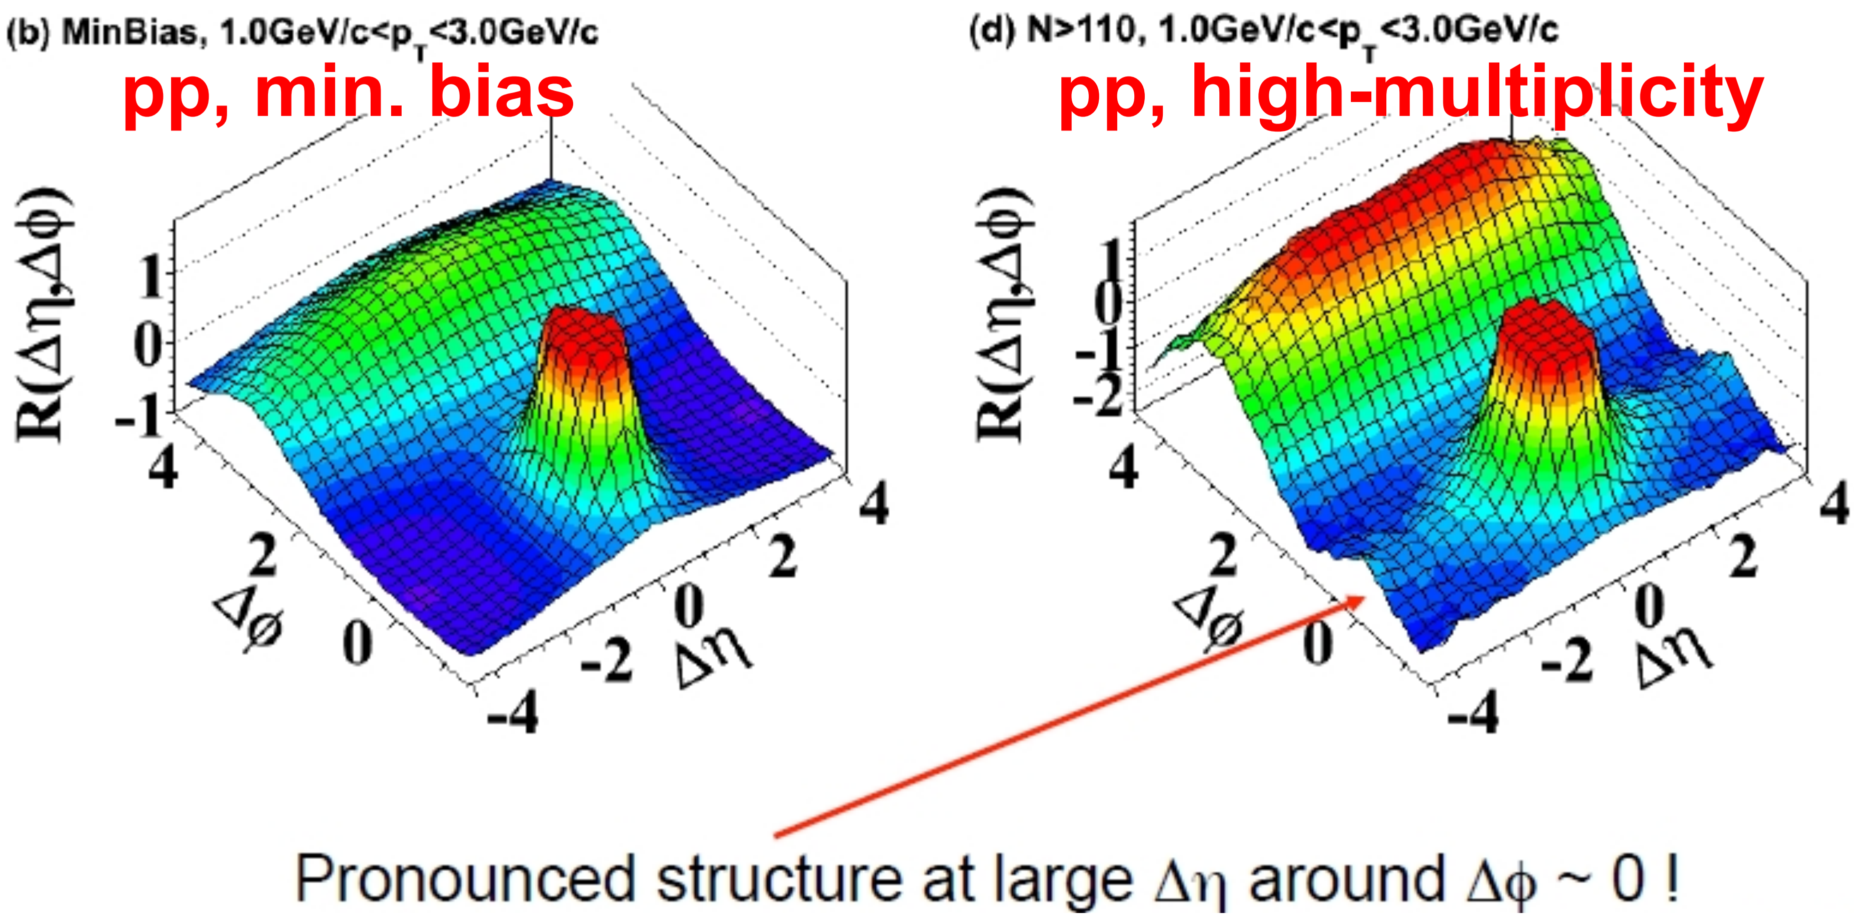
- LHC energy and luminosity allow for study of pp and p-Pb collisions with very high particle multiplicity
  - e.g. pp or p-Pb events with same multiplicity as non-central nucleus-nucleus at RHIC energy
- Look for similar effects as seen in nucleus-nucleus!
- E.g. characteristic patterns in two-particle correlations

PbPb



Two-particle correlations: near-side ridge

- Near-side ridge (long-range correlation in η at $\Delta\phi$=0) observed in high-multiplicity pp and p-Pb (CMS)

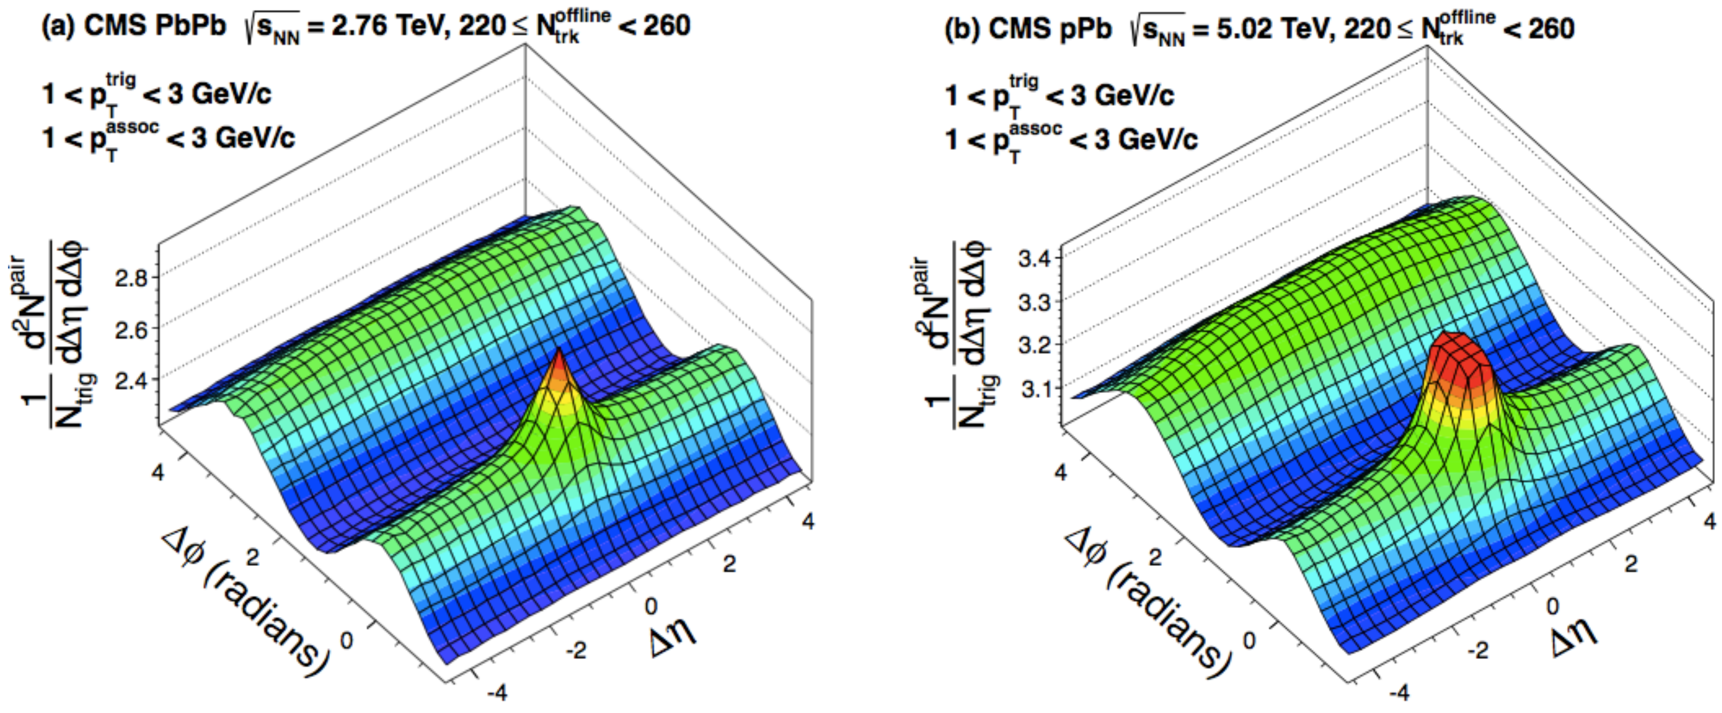


CMS, JHEP 1009 (2010) 091

Two-particle correlations: near-side ridge

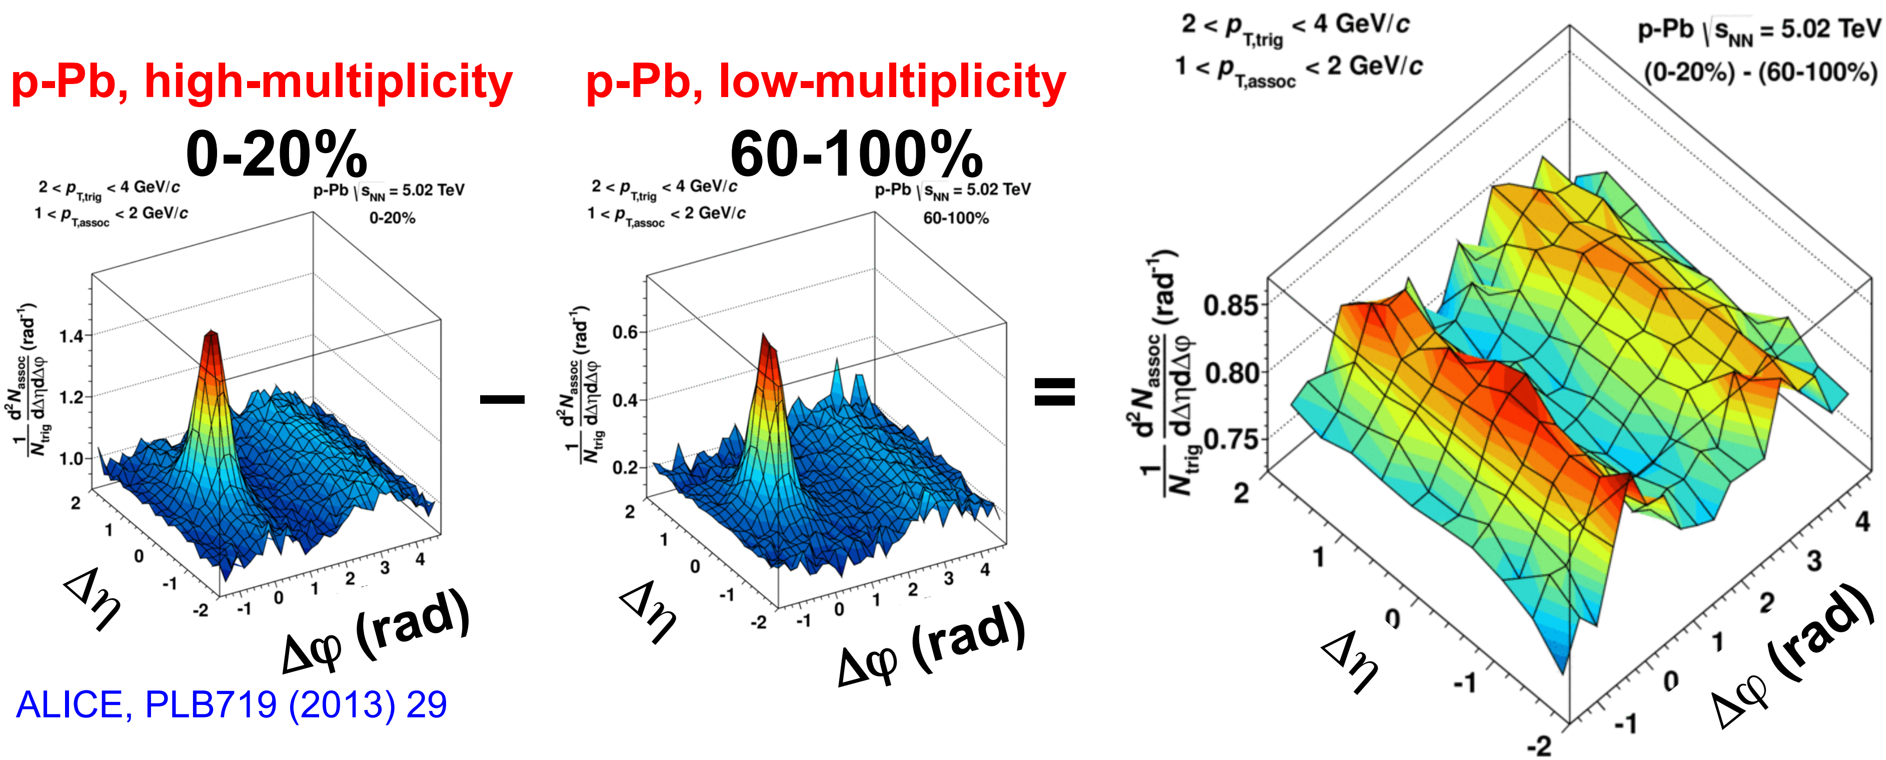
- Near-side ridge (long-range correlation in η at $\Delta\phi=0$) observed in high-multiplicity pp and p-Pb (CMS)

Pb-Pb **p-Pb, high-multiplicity**



CMS, PLB 724 (2013) 213

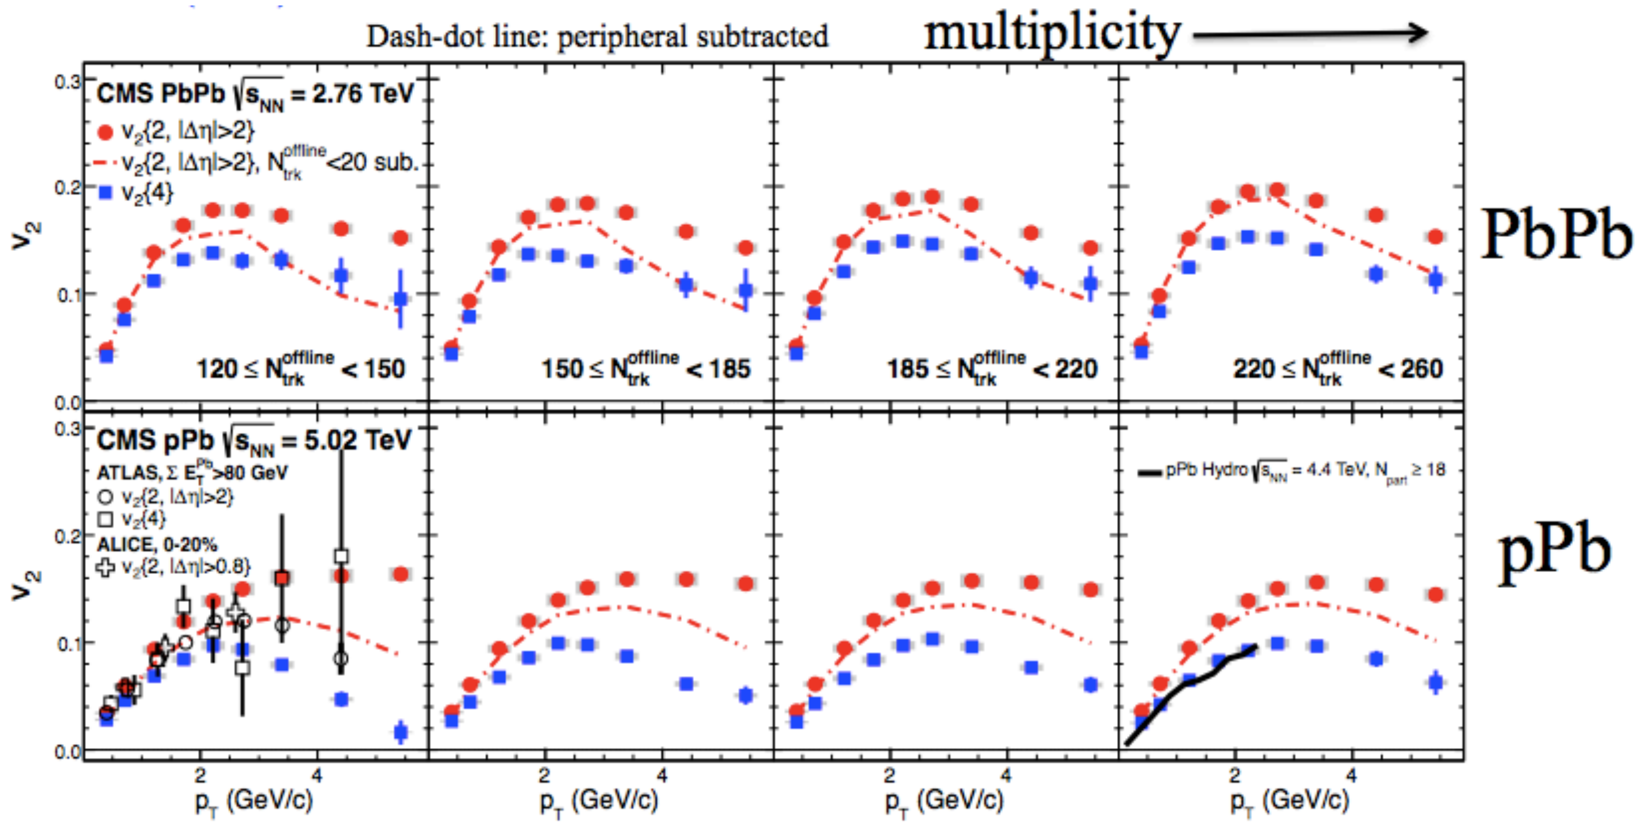
Two-particle correlations: double-ridge!



ALICE, PLB719 (2013) 29

- Idea: subtract the "pp-like" structure of low-multiplicity p-Pb from the structure of high-multiplicity p-Pb
- Double ridge discovered by ALICE, followed by ATLAS
- Resembles the structure that in Pb-Pb is attributed to collective flow

Quantifying the modulation: v_2

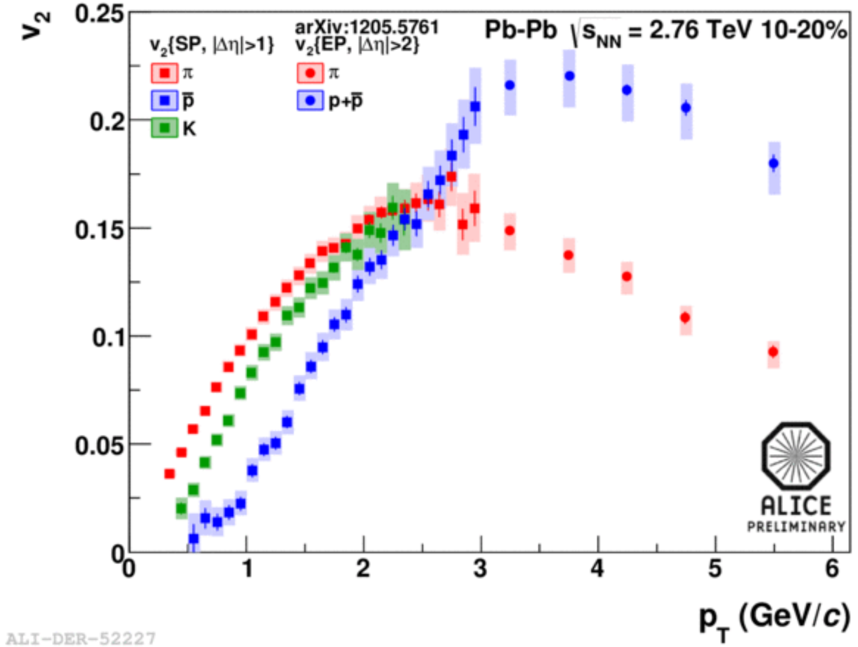


- v_2 vs. p_T and multiplicity with various methods
- Similar pattern in p-Pb and Pb-Pb
- v_2 rises to 2 GeV, then ~flattens out to 5

CMS, PLB 724 (2013) 213

Is it *flow* in p-Pb?
Look at identified particles

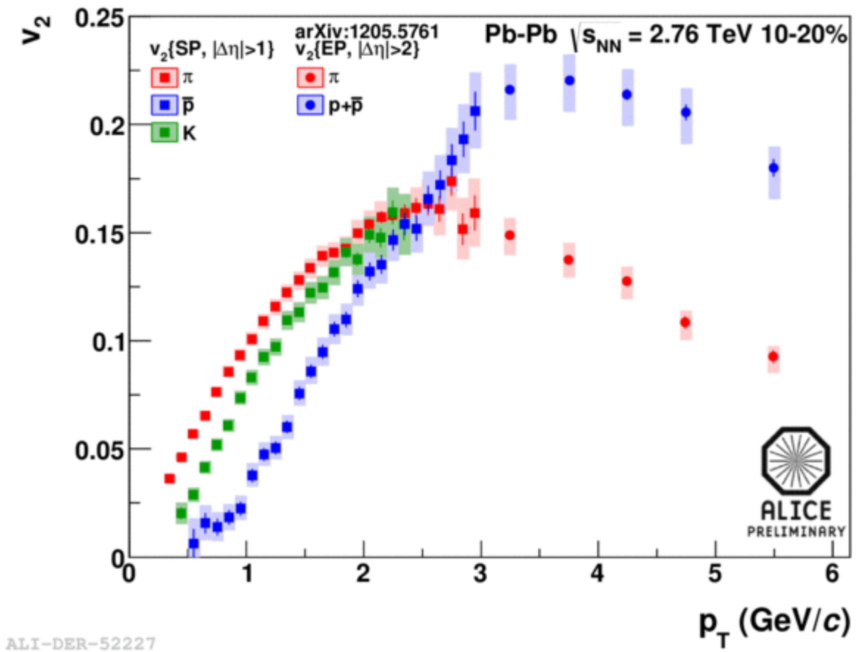
Pb-Pb



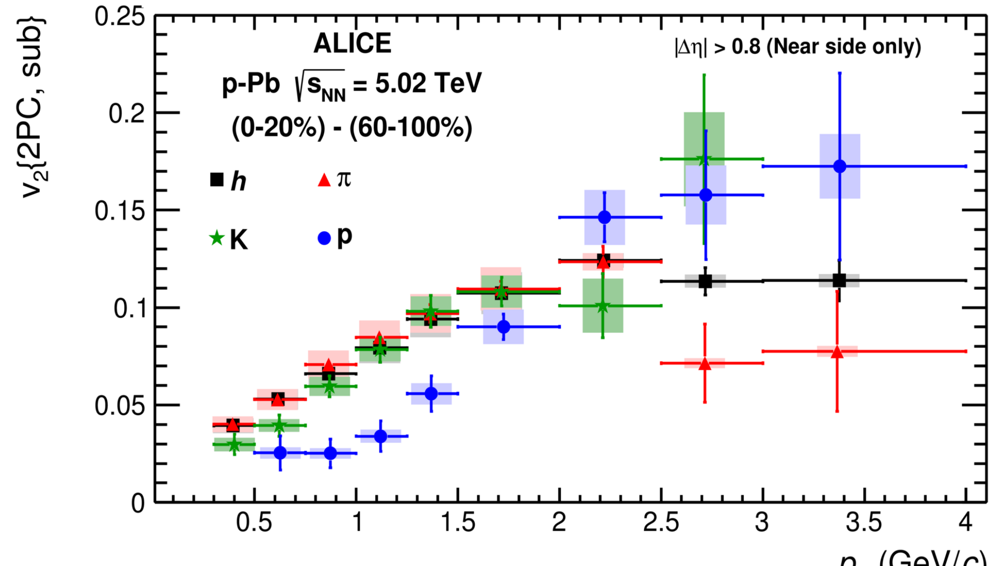
- Mass ordering, interpreted in terms of collective radial and elliptic flow

Is it *flow* in p-Pb?
Look at identified particles

Pb-Pb



p-Pb, high-multiplicity



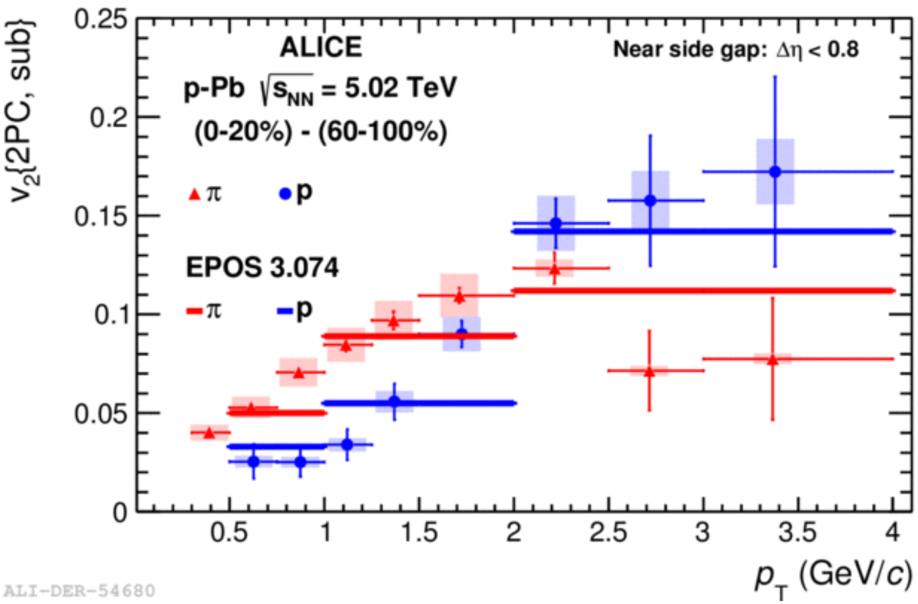
ALICE, arXiv:1307.3237

- Mass ordering, interpreted in terms of collective radial and elliptic flow

- Clear indication for mass ordering in p-Pb
- Resembles Pb-Pb and supports "flow" picture

Possible interpretations

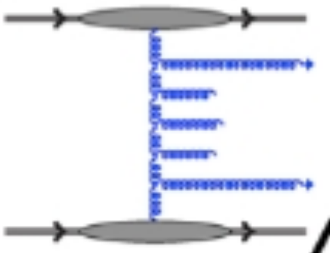
- High-multiplicity p-Pb presents several aspects that in Pb-Pb are explained by collective flow of an expanding medium
- Models including hydrodynamical expansion can describe the observations (e.g. EPOS)

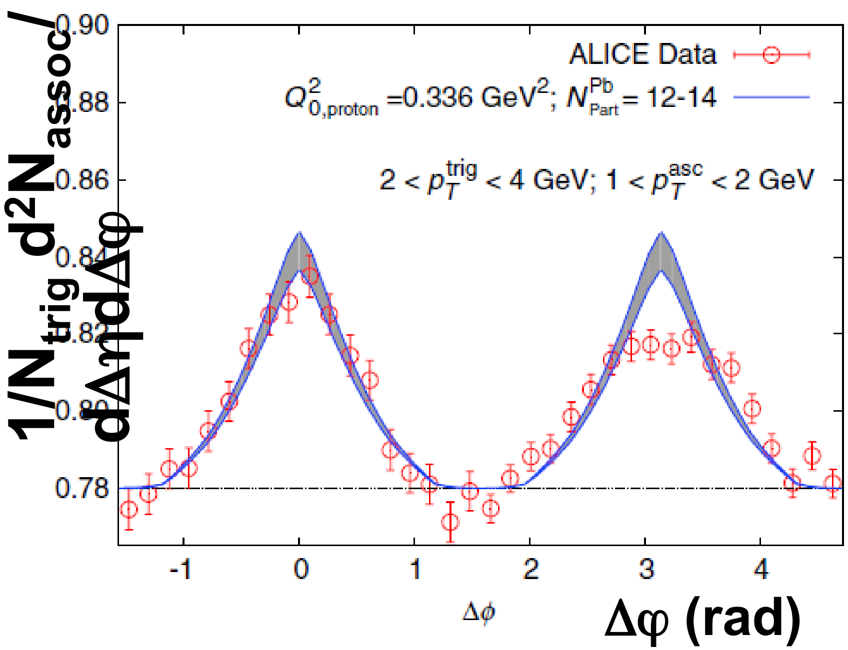


EPOS: Klaus Werner, arXiv:1307.4379

Possible interpretations

- High-multiplicity p-Pb presents several aspects that in Pb-Pb are explained by collective flow of an expanding medium
- Hydrodynamical expansion
- Alternative explanation (1): Initial-state effect, CGC (Colour Glass Condensate) many-gluon processes can yield correlations

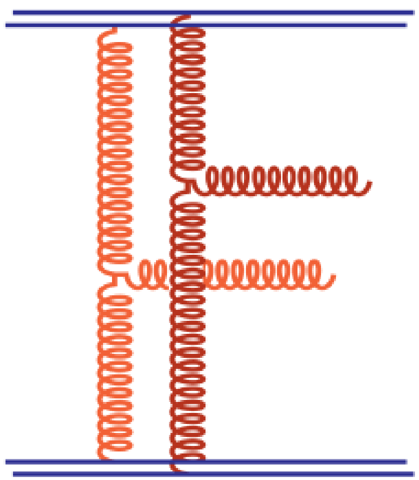


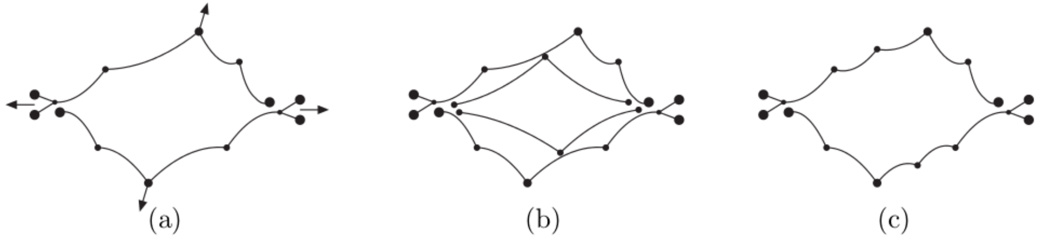


Dusling, Venugopalan, PRD 87, 094034 (2013)

Possible interpretations

- High-multiplicity p-Pb presents several aspects that in Pb-Pb are explained by collective flow of an expanding medium
- Hydrodynamical expansion
- Alternative explanation (1): Initial-state effect
- Alternative explanation (2): MPI (multi-parton interactions) and "colour reconnection" (as implemented in PYTHIA8) can induce flow-like effects





see e.g. Ortiz et al, PRL111, 042001 (2013)

Possible interpretations

- High-multiplicity p-Pb presents several aspects that in Pb-Pb are explained by collective flow of an expanding medium
- Hydrodynamical expansion
- Alternative explanation (1): Initial-state effect
- Alternative explanation (2): MPI and “colour reconnection”

These results are clearly intriguing, several interpretations are being put forward, and new measurements from the experiments will provide stringent tests for theory
