

Go4 Analysis design

J.Adamczewski-Musch, H.G.Essel, S.Linev

Go4 Workshop 2010

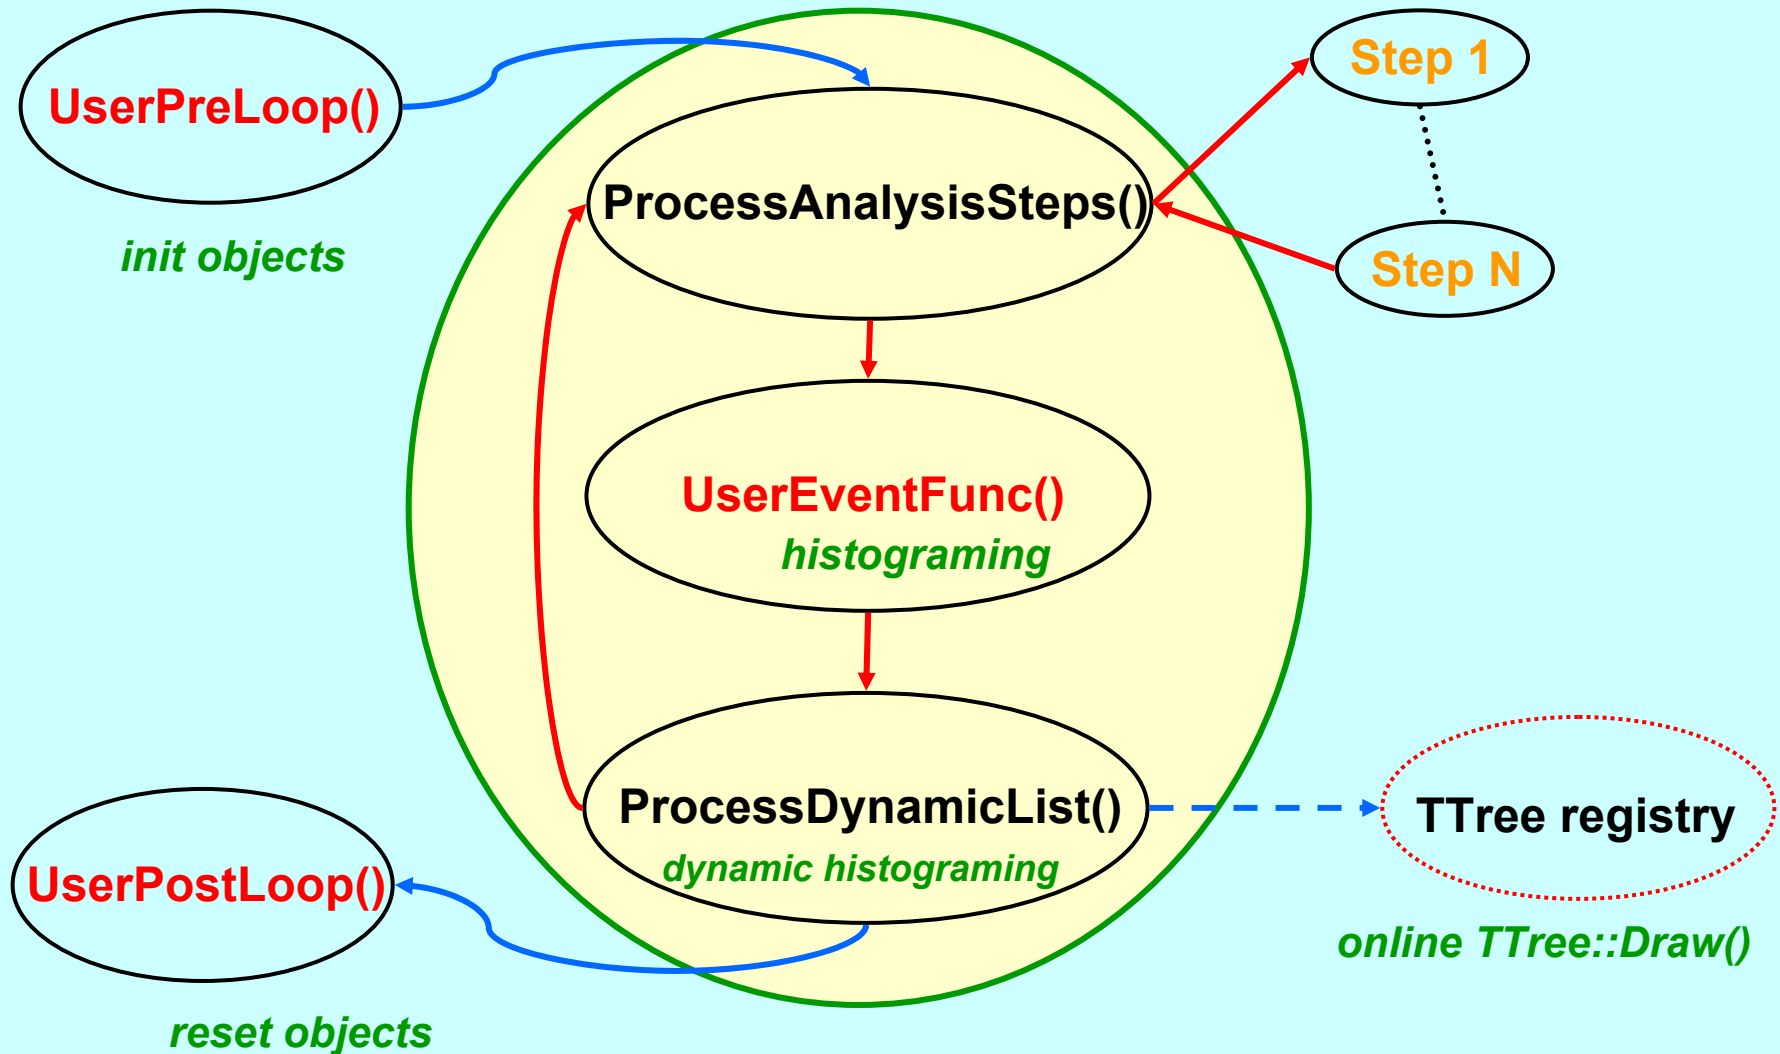

Analysis framework

- **TGo4Analysis** baseclass:
 - Analysis setup (chain of analysis steps)
 - Object organization, dynamic histograms
 - Implicit / explicit event loop
 - Virtual methods to be defined
in **user analysis subclass**
- **TGo4AnalysisStep**:
 - defines one stage of the analysis,
implements event classes

User may design own subclass of TGo4Analysis

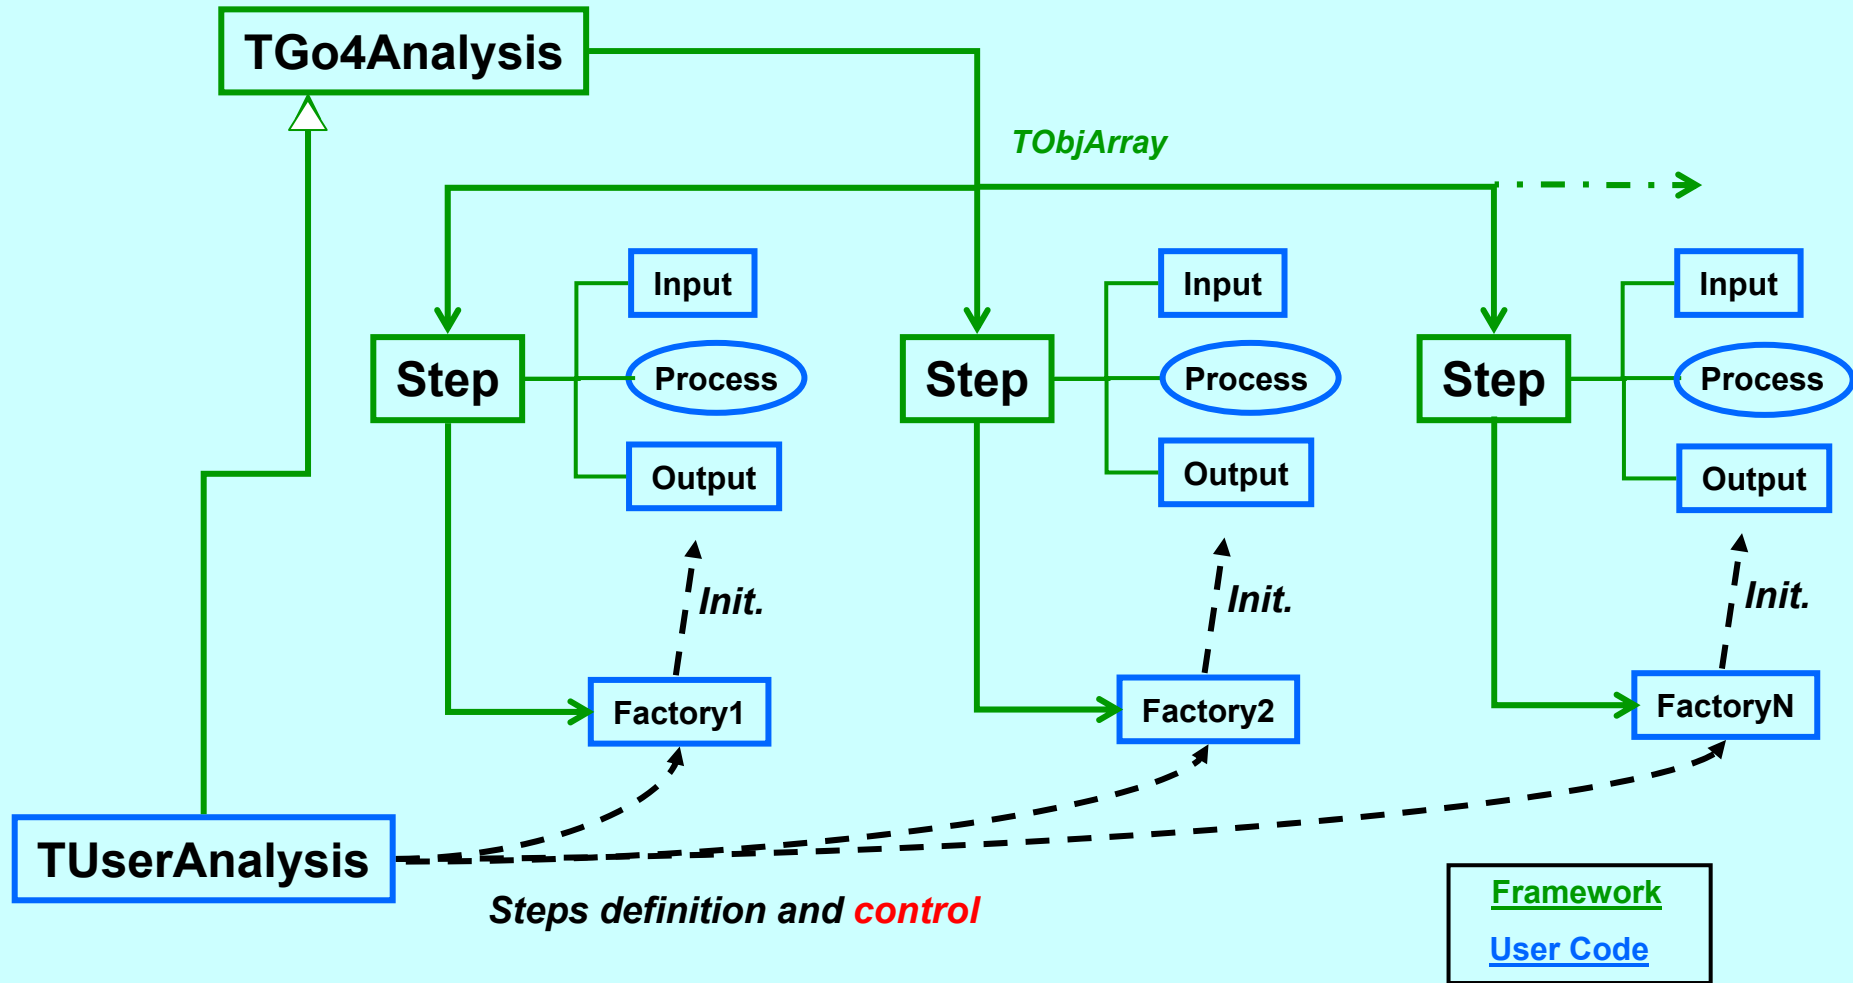

Analysis event loop

Analysis steps

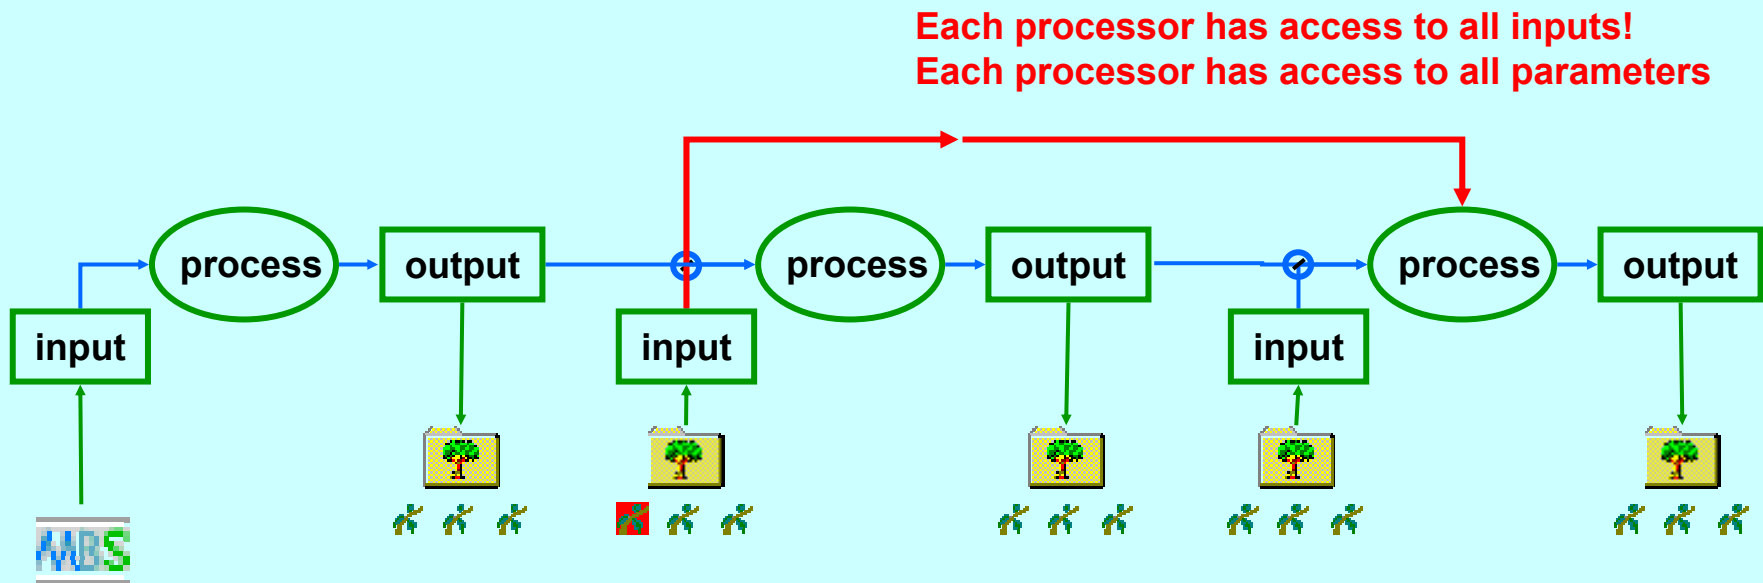

Analysis steps

Chain of analysis steps processed **sequentially**

Each step can be **en/disabled** (framework)

Input/output can be switched (framework)

Event Base Classes

- **TGo4EventElement:**
Event structure (input and output event)
User methods: *Clear()*, *Fill()* (optional)
- **TGo4EventSource:**
Fills event structure with data;
Framework! **User event source optional**
- **TGo4EventStore:**
Stores event structure; Framework!
- **TGo4EventProcessor:**
Converts input event into output event;
User methods: *BuildEvent(TGo4EventElement* e)*
any other methods optional
- **TGo4EventFactory:**
Defines the user implementations of all the above
at initialization
Framework: **TGo4StepFactory**. **User factory optional.**

Implemented Services

- GSI standard DAQ (**Mbs**)

 - TGo4MbsEvent, TGo4MbsSubEvent (format 10,1)

 - TGo4MbsFile (read from *.lmd)

 - TGo4MbsEventServer, TGo4MbsStream, TGo4MbsTransport
(connect to Mbs)

 - TGo4RevServ (connect to remote event server mreverserv)

- Complex event structures „toolbox“:

 - TGo4CompositeEvent

- **Root I/O** :

 - TGo4FileSource, TGo4FileStore :
wraps 1 TTree in 1 TFile

 - TGo4BackStore :
1 TTree in memory only (<- online TTree::Draw())

Analysis Setup from GUI

Step selection

Analysis Configuration

Unpack xxx Analysis xox step overview

Step Control

Enable Step Source Store

Event source

MBS Stream Server

Name: r3g-2

0 all 1 1 s

Event store

Go4FileStore (1 tree/step) (*.root)

Name: workshop_events.root

99 100 kB 3 Overwrite

Auto Save File

workshop_auto.root

Enabled 300 s 5 Overwrite

Analysis Configuration File

Go4AnalysisPrefs.root

Submit Submit+Start Close

Load/save config

Analysis Setup from command line

standard executable **go4analysis**

- provided by framework
(no user compilation of **MainUserAnalysis** program required anymore!)
- **generic command line arguments** for analysis set up
- **optional arguments** passed to user's TGo4Analysis subclass

examples:

- `go4analysis -stream r3g2 -step 0 -store workshop_events.root
-step 1 -store workshop_analyzed.root -asf workshop_auto.root`
(setup as from gui: mbs stream server as data source, 1. and 2. step storage files, autosave file specified)
- `go4analysis -file gauss.lmd -disable_store
-step Analysis -store analyzed_events.root -number 100000 -disable_asf`
(process 100000 events from file gauss.lmd, no store of first step, storage file of step „Analysis“, autosave disabled)
- `go4analysis -user mydaq.gsi.de -server dataserver -norun -v 2 -log logfile.txt`
(start analysis as data server, user defined DAQ event source, do not start processing, log output to file with verbosity 2)
- `go4analysis -file gauss.lmd -args result.root 1 5000 7.0 42`
(process file and pass user specific arguments to analysis constructor)
- `go4analysis -help`
(show all options)

Examples of Go4 analyses

- **Go4ExampleSimple:**
 - 1 analysis step, dummy output event
 - no user analysis class, framework TGo4StepFactory
- **Go4Example1Step (-> ExampleModular):**
 - 1 analysis step with filled output event
 - user analysis class, framework TGo4Stepfactory
- **Go4ExampleAdvanced (previous demo)**
 - 2 analysis steps, 2 output events
 - user analysis class, framework TGo4Stepfactory
- **FRS framework analysis**
 - 4 standard steps + 1 user step, all with output events
 - user analysis class, user step factories, processor user baseclass

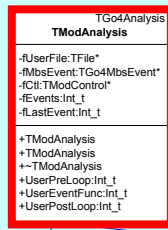

TGo4EventProcessor
