## HOW TO DETERMINE MASSES AT RELATIVISTIC ENERGIES ?

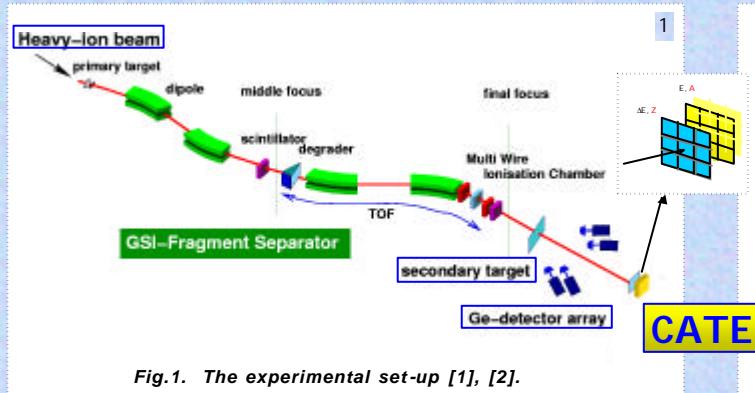

Fig.1. The experimental set-up [1], [2].

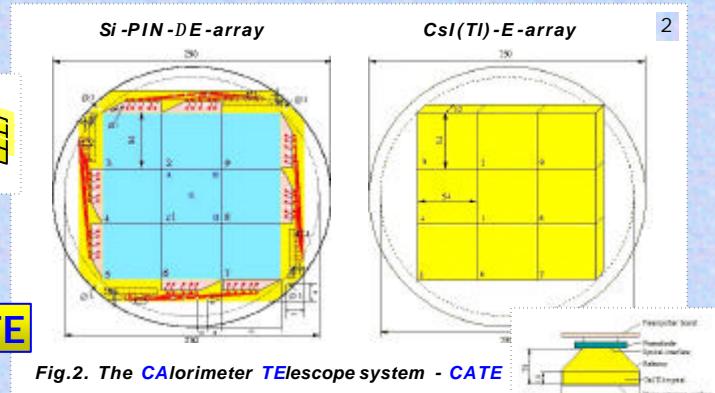

Fig.2. The CALorimeter TElescope system - CATE

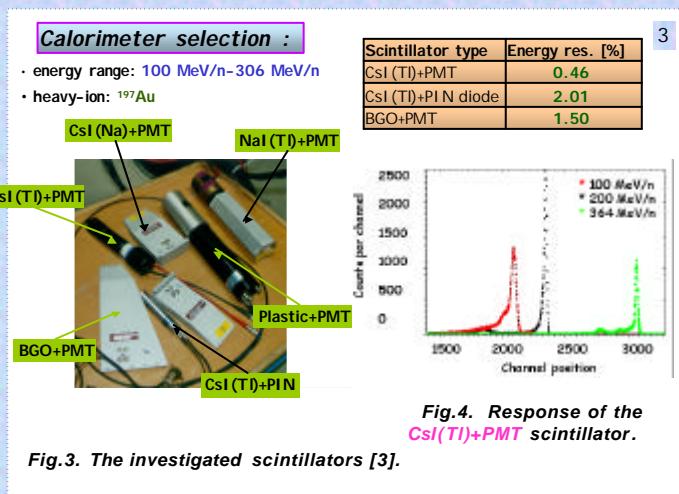

Fig.3. The investigated scintillators [3].

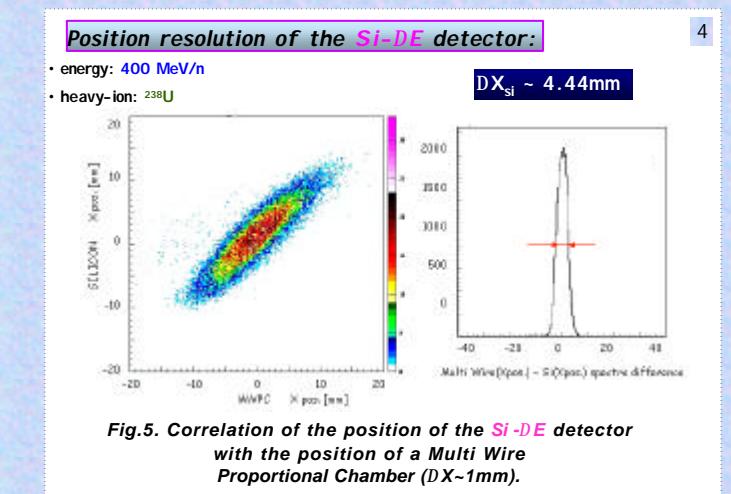

Fig.4. Response of the CsI(Tl)+PMT scintillator.

Fig.5. Correlation of the position of the Si-DE detector with the position of a Multi Wire Proportional Chamber ( $D_X \sim 1\text{mm}$ ).

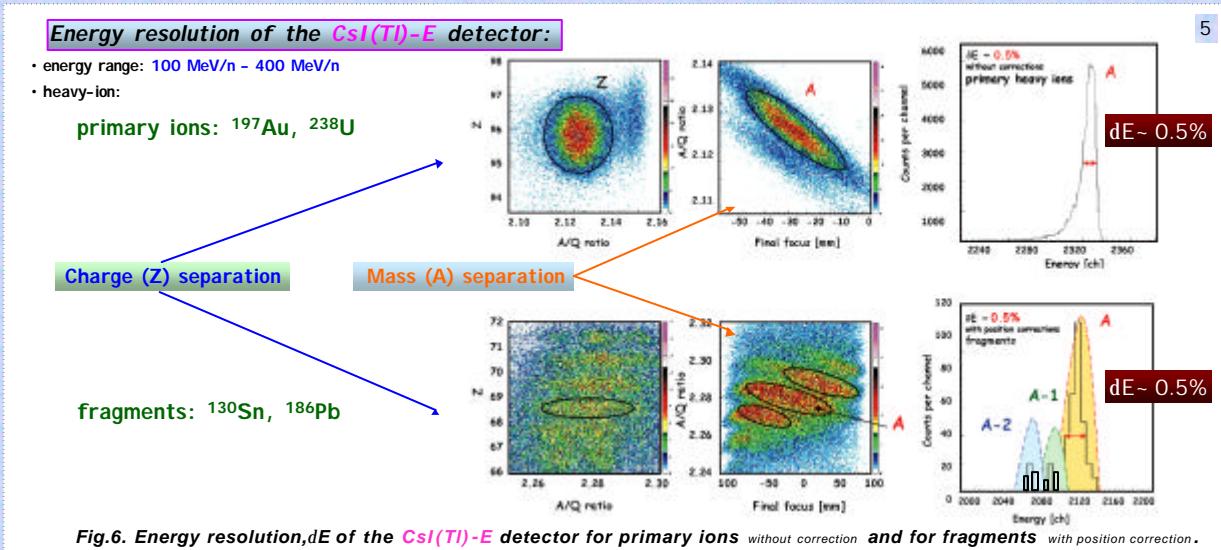

Fig.6. Energy resolution,  $dE$  of the CsI(Tl)-E detector for primary ions without correction and for fragments with position correction.

The in-beam investigation of the CATE system revealed a position resolution of 4.4mm and an energy resolution of 0.5% corresponding to a mass resolution  $DA \sim 1/200$ . In a previous measurement [4] the charge resolution of the Si-detector has already been determined to be  $DZ \sim 1/200$ . Thus CATE is well suited for mass and charge determination of relativistic heavy-ions and will be employed in the RISING [1] project at GSI.
