GSI Summer School 23.7.2019

Table of contents

1. Radioactivity
2. Interaction of radiation with matter
3. Radiobiology
4. Heavy ions
 - Space radiation
5. Radiotherapy
 - Conventional X-ray therapy
 - Particle therapy
6. Therapy and space

1. Radioactivity

W. C. Röntgen's experiment
in Würzburg

Radiograph of
Mrs. Röntgen's hand,
the first x-ray image
ever taken,
22 Dec. 1895, published in
The New York Times
January 16, 1896

An early XXth century
X-ray tube

February 1896: Becquerel discovers radioactivity

1 Bq= 1 disintegration/second

First image of potassium uranyl disulfate on 24 February 1896 was the discovery of natural radioactivity

Antoine Henry Becquerel

2. Interaction of radiation with matter

Interaction of x or γ rays (photons) with matter: **Ionization**

Compton Effect

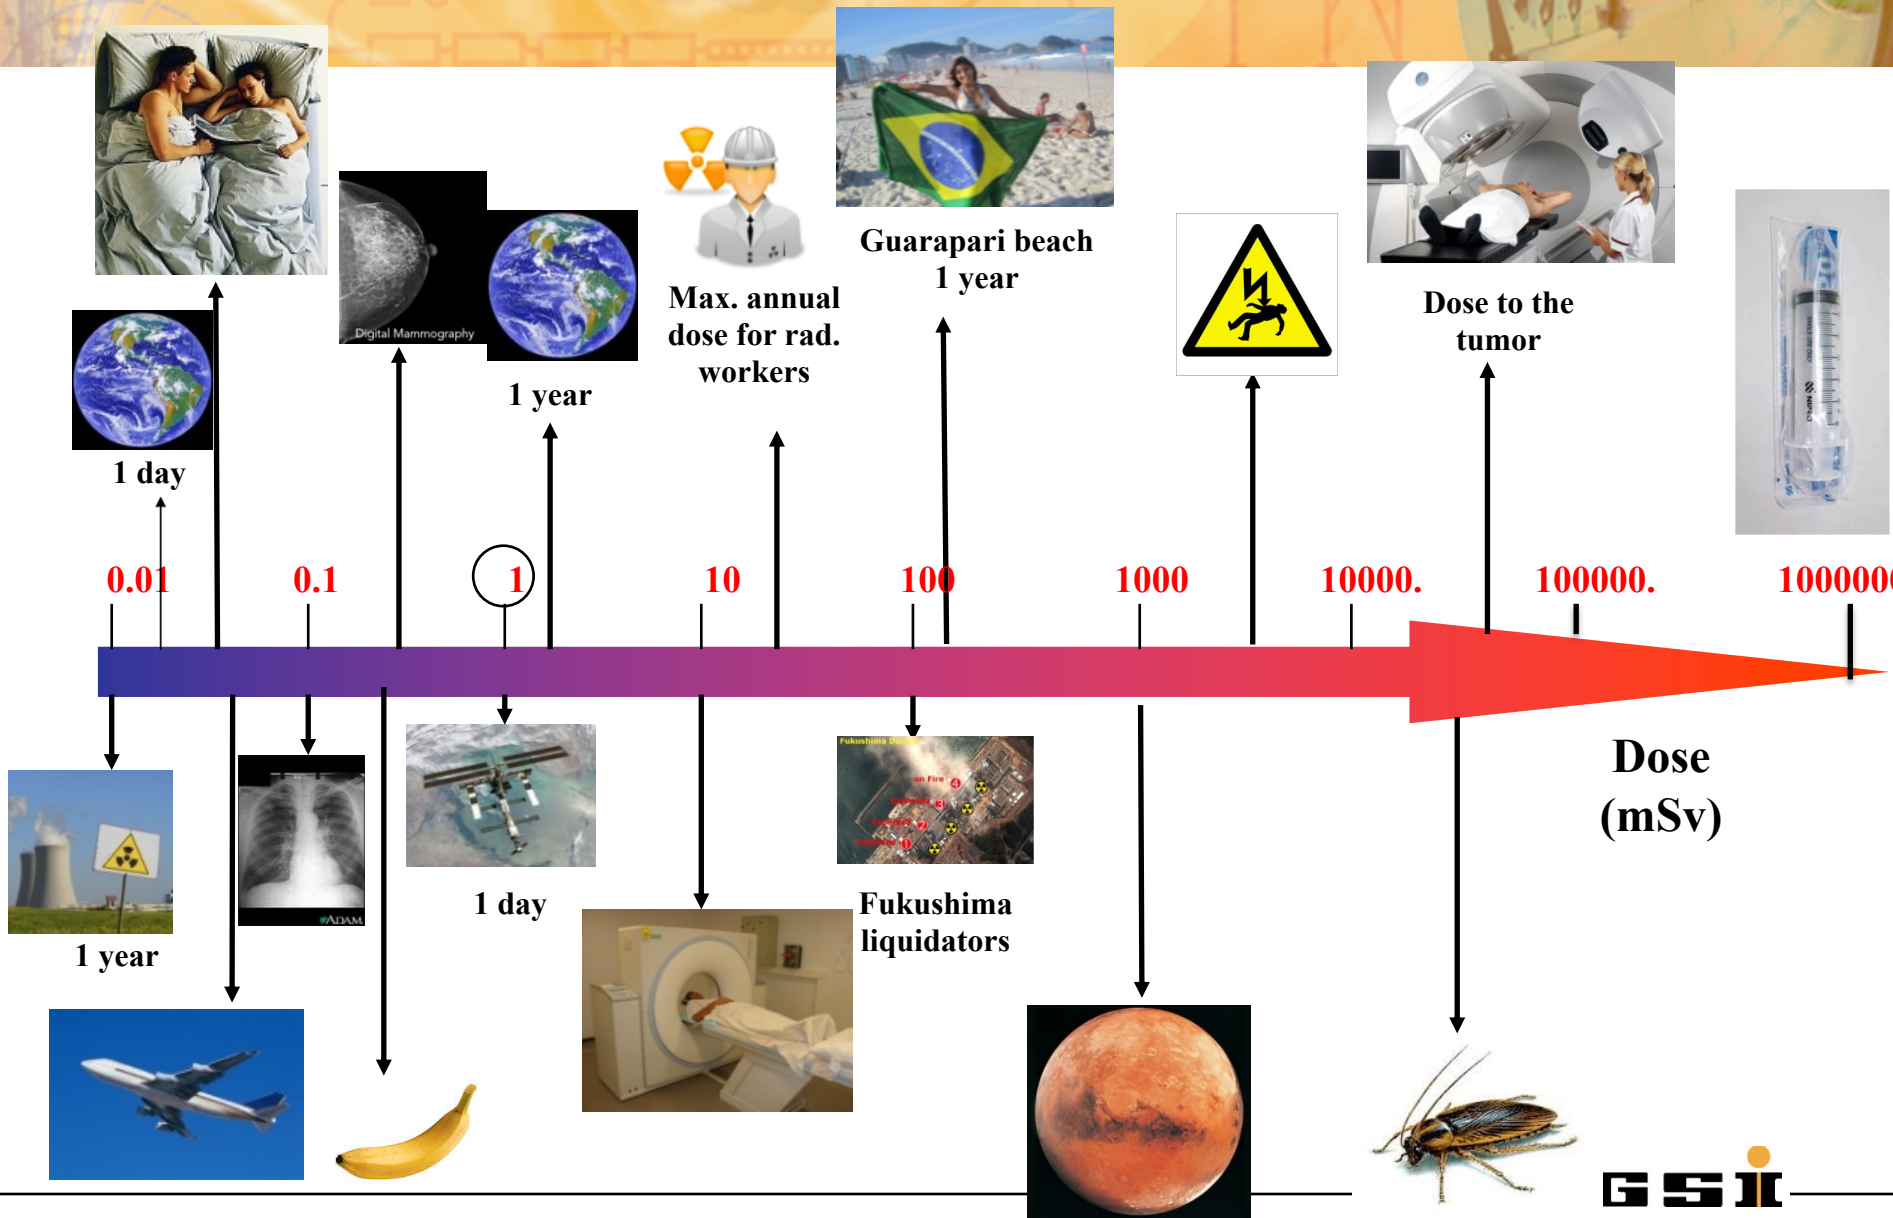

Interaction of electrons or ions with matter:

Ionization (Coulomb interaction)

Radiation effects depends on the DOSE

Dose is an energy per unit mass and is measured in Sievert = Joule/kg

3. Radiobiology

- **High energy radiation breaks chemical bonds.**
 - **This creates free radicals, like those produced by other insults as well as by normal cellular processes in the body.**
 - **The free radicals can change chemicals in the body.**

The most unkindest cut of all

(W. Shakespeare, Julius Caesar)

How does this damage from ionizing radiation effect our bodies?

Sufficient Cell Killing

Deterministic effects

Sufficient Genetic Alterations

Stochastic effects

What we know about effects of terrestrial radiation (γ , X-rays) in humans

But we know little about **charged particles**....

γ-rays

silicon

iron

GCR Ion Tracks Are Dangerous

4. Heavy ions

Tracks in chromatin fibre

An Analogy for Structured Energy Deposition and its Consequences

Low LET radiation produces isotropic damage to organized targets.

High LET radiation produces correlated damage to organized targets.

LET: Linear Energy Transfer

1 Dose Unit

Low LET radiation deposits energy in a uniform pattern

1 Dose Unit

High LET radiation deposits energy in a non-uniform pattern

Why are we interested in energetic heavy ions?

Heavy ion radiation is not present naturally on Earth

The Space Radiation Environment

Solar particle events (SPE) (generally associated with Coronal Mass Ejections from the Sun):

medium to high energy protons

largest doses occur during maximum solar activity

not currently predictable

MAIN PROBLEM: develop realistic forecasting and warning strategies

Trapped Radiation:

medium energy protons and electrons

effectively mitigated by shielding

mainly relevant to ISS

MAIN PROBLEM: develop accurate dynamic model

Galactic Cosmic Rays (GCR)

high energy protons

highly charged, energetic atomic nuclei (HZE particles)

not effectively shielded (break up into lighter, more penetrating pieces)

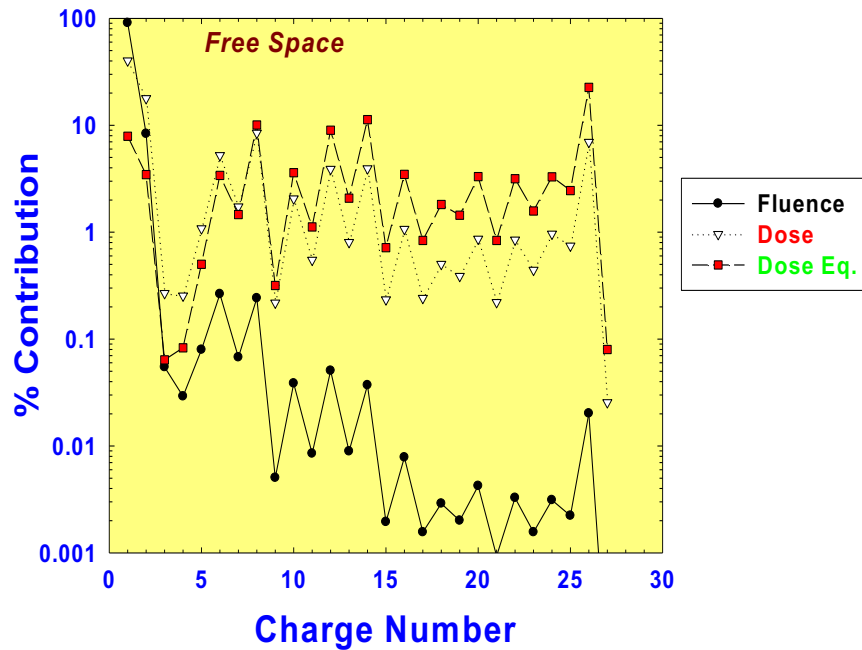

abundances and energies quite well known

MAIN PROBLEM: biological effects poorly understood but known to be most significant space radiation hazard

Galctic Cosmic Radiation

GCR Charge Contributions

Apoollo 50 NEXT GIANT LEAP

The graphic features the word 'Apoollo' in a large, white, stylized font. The two 'O's are replaced by images of the Moon and Mars. Below 'Apoollo' is the number '50' in a similar font. To the right of '50' is the text 'NEXT GIANT LEAP'. The background is a dark blue space scene with stars and nebulae.

POCKET CARTOON
by [unreadable]

LATEST NIXON TALKS TO MOONMEN

The newspaper front page shows the headline 'MAN STEPS ON TO MOON' in large, bold letters. Above it is the sub-headline '3.56 am: 'One small step for man but one giant leap for mankind''. To the right of the main headline is a small, grainy photograph of the lunar surface. Below the main headline are several smaller sections: 'The landing: Page 2', 'Where next? and OPINION: Page 6', 'POCKET CARTOON by [unreadable]', and 'LATEST NIXON TALKS TO MOONMEN'.

NASA shows on their heliophysics .gov site that there is nothing filtering or slowing the particles from the sun. There are things accelerating them and condensing them like our accelerators do.

Biological effects of heavy ions

No human epidemiological data

A wide-angle photograph of a large industrial facility, likely a particle accelerator. The room is filled with complex machinery, including large yellow and red units. Several workers in casual attire are visible, some standing near the equipment and others working. The ceiling is high and features a dense network of metal beams, pipes, and electrical conduits. The lighting is bright and even. In the foreground, a blue cart with several red and white containers is visible on the right side.

5. RADIOTHERAPY

External Beam Radiation Therapy

3D Conformal Technique for Treating Prostate Cancer 

Radiotherapy

- Also called “Radiation Therapy”
- Part of multi-disciplinary approach to cancer care
- Useful for 50-60% of all cancer patients
- Can be given for cure or palliation
- Mainly used for loco-regional treatment
- Benefits and side-effects are usually limited to the area(s) being treated

Therapeutic window

Dose-Response Curves for tumour and normal tissues

Side-effects of Radiotherapy

Acute (<1 month)

Depend on area(s) being treated

Often fatigue can occur

mucositis/esophagitis, nausea, diarrhea and redness of skin

Late (>1 month)

Pneumonitis/fibrosis of lungs

Hypothyroidism

Xerostomia

Enteritis

Infertility/menopause

Long-term (10-20 years)

Increased risk of secondary cancers

Increased heart disease if chest region treated

Depth dose distribution of various radiation qualities

X-ray dose decrease with depth

We have to cross-fire on the tumor from many angles

Single field

Dose per field

Total dose

Excellent target conformity
Large normal tissue volume irradiated

Future biomedical research at FAIR and other new accelerators

Darmstadt, Germany

May 20-22, 2019

www.gsi.de/bio-coll

The Facility for Antiprotons and Ion Research (FAIR) is the new International accelerator facility presently under construction at the site of the GSI Helmholtz Institute in Darmstadt, Germany. The new facility, where various physics programs can be operated in parallel, will offer outstanding research opportunities and discovery potential for about 3000 scientists from about 50 countries. International Collaborations in hadronic physics, nuclear structure etc. are already actively working to prepare the experiments for the opening of FAIR.

FAIR will also host an intense and innovative program in applied nuclear physics (APPA), and in particular in biophysics. In fact, FAIR can offer unique opportunities for biomedical research. The production of very high energy (10 GeV/n) heavy ions is very important for studies in space radiation protection, both in biology and microelectronics. The high energy can also be used for particle radiography and theranostics, whereas the high intensity of the FAIR beams gives opportunities for using high-energy radioactive ion beams and ultra-high dose rates in particle therapy, and for the production of new radioisotopes.

On May 20-22, 2019 we will host at GSI in Darmstadt the

1st Meeting of the International Biophysics Collaboration

Every scientists interested in biomedical applications at particle accelerator is invited to contribute with your ideas and proposals. The participation is free, but registration on this webpage is mandatory. All information on the meeting will be posted on this website.

The International Biophysics Collaborations goes beyond FAIR. In fact, there are many new accelerator facilities under construction all over the world (e.g. NICA in Russia, RAON in Korea, FRIB in USA, SPIRAL2 and SPES in Europe, etc.) where applied nuclear physics program are planned and biomedical research will be possible. The International Collaboration that we want to create will serve all these facilities, and will develop research programs and specific devices for use at various accelerators. The meeting will create a community of applied nuclear physics at accelerators that will look for new exciting research opportunities generated by the new facilities. To give a structure to the Collaboration, we will elect a spokesperson and an executive committee that will establish working groups and task forces on different topics.

We look forward to seeing you in Darmstadt!
