

# TRD variables for run queries

## comments to the existing ones

- 🌐 B should have a number (with sign, and in T or A)
- 🌐 suppose some runs were not reconstructed. How would we notice this in the query?

## missing

- 🌐 PH (in drift region)
  - 🌐 phi\_tracklet-phi\_track
  - 🌐 y\_tracklet-y\_track
  - 🌐 z\_tracklet-z\_track
  - 🌐 noise
  - 🌐 gain
  - 🌐 vdrift
  - 🌐 t0
  - 🌐 number of events in the run
  - 🌐 registered at GSI (?)
- from QA
- from OCDB
- mean over chamber  
then, histogram these means  
then, peak position, rms, area

maybe do not have to be added to run tags, but to be extracted and put into Pauls db when collecting info from run tags
