2. coupling of two angular momenta
3.  $\delta$ -interaction - pairing
4. generalized seniority scheme
5. signatures near closed shells

# Evolution of nuclear structure (as a function of nucleon number)

# Shell model with residual interaction

$$H = H_0 + H_{residual}$$

Start with 2-particle system, that is a nucleus „doubly magic nucleus + 2 nucleons“

$$H_{residual} = H_{12}(r_{12})$$

Consider two identical valence nucleons with  $j_1$  and  $j_2$

Two questions:

What total angular momenta  $j_1 + j_2 = J$  can be formed?

What are the energies of states with these  $J$  values?

# Nuclear shell structure

**Table 1 -- Nuclear Shell Structure** (from *Elementary Theory of Nuclear Shell Structure*, Maria Goeppert Mayer & J. Hans D. Jensen, John Wiley & Sons, Inc., New York, 1955.)

Angular Momentum ( $\hbar/2\pi$ )	Spin-Orbit Coupling ( $1/2, 3/2, 5/2, 7/2, \dots$ )	Number of Nucleons Shell	Magic Number

$$E(2g_{9/2}) - E(3p_{1/2}) = BE(^{209}\text{Pb}) + BE(^{207}\text{Pb}) - 2 \cdot BE(^{208}\text{Pb}) = -3.432$$

# Level scheme of $^{210}\text{Pb}$

# Coupling of two angular momenta

$\mathbf{j}_1 + \mathbf{j}_2$  all values from:  $j_1 - j_2$  to  $j_1 + j_2$  ( $j_1 = j_2$ )

Example:  $j_1 = 3, j_2 = 5$ :  $J = 2, 3, 4, 5, 6, 7, 8$

**BUT:** For  $j_1 = j_2$ :  $J = 0, 2, 4, 6, \dots (2j - 1)$  (Why these?)

# Coupling of two angular momenta

How can we know which total angular momenta  $J$  are observed for the coupling of two identical nucleons in the same orbit with angular momentum  $j$ ?

Several methods: easiest is the “**m-scheme**”.

**Table 5.1** *m* scheme for the configuration  $|(7/2)^2 J)^*$

$j_1 = 7/2$ $m_1$	$j_2 = 7/2$ $m_2$	$M$	$J$
7/2	5/2	6	6
7/2	3/2	5	
7/2	1/2	4	
7/2	-1/2	3	
7/2	-3/2	2	
7/2	-5/2	1	
7/2	-7/2	0	
5/2	3/2	4	4
5/2	1/2	3	
5/2	-1/2	2	
5/2	-3/2	1	
5/2	-5/2	0	
3/2	1/2	2	2
3/2	-1/2	1	
3/2	-3/2	0	
1/2	-1/2	0	0

\* Only positive total  $M$  values are shown. The table is symmetric for  $M < 0$ .

# Coupling of two angular momenta

# Residual interaction - pairing

## ➤ Spectrum of $^{210}\text{Pb}$ :

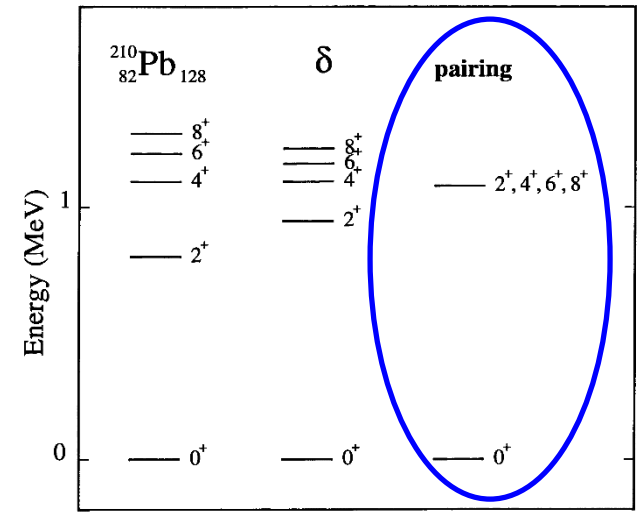

$^{208}\text{Pb}_{126}$  core + 2 neutrons

$$|g_{9/2}^2; J = 2, 4, 6, 8\rangle \quad \nu = 2 \quad (\text{two unpaired nucleons})$$

## ➤ Assume pairing interaction in a single-j shell

$$\langle j^2 JM_J | V_{\text{pairing}}(r_1, r_2) | j^2 JM_J \rangle = \begin{cases} -\frac{1}{2}(2j+1) \cdot g & \nu = 0, J = 0 \\ 0, & \nu = 2, J \neq 0 \end{cases}$$

For the ground state the energy eigenvalue is non-zero;  
all nucleons paired ( $\nu=0$ ) and spin  $J=0$ .

## ➤ The $\delta$ -interaction yields a simple geometrical expression for the coupling of two nucleons

$$\Delta E(j_1 j_2 J) = \langle j_1 j_2 JM | V_{12} | j_1 j_2 JM \rangle = \frac{1}{\sqrt{2J+1}} \langle j_1 j_2 J || V_{12} || j_1 j_2 J \rangle$$

wave function:  $\varphi(n\ell m) = \frac{1}{r} R_{n\ell}(r) \cdot Y_{\ell m}(\theta, \phi)$

interaction:  $V_{12}(\delta) = \frac{-V_0}{r_1 r_2} \delta(r_1 - r_2) \delta(\cos\theta_1 - \cos\theta_2) \delta(\phi_1 - \phi_2)$

$$\Delta E(j_1 j_2 J) = -V_0 \cdot F_R(n_1 \ell_1 n_2 \ell_2) \cdot A(j_1 j_2 J)$$

with  $F_R(n_1 \ell_1 n_2 \ell_2) = \frac{1}{4\pi} \int \frac{1}{r^2} R_{n_1 \ell_1}^2(r) R_{n_2 \ell_2}^2(r) dr$

and  $A(j_1 j_2 J) = (2j_1 + 1) \cdot (2j_2 + 1) \cdot \begin{pmatrix} j_1 & j_2 & J \\ 1/2 & -1/2 & 0 \end{pmatrix}^2$

# $\delta$ -interaction (semiclassical concept)

$$J^2 = j_1^2 + j_2^2 + 2|j_1||j_2|\cos\theta$$

$$\cos\theta = \frac{J^2 - j_1^2 - j_2^2}{2|j_1||j_2|} = \frac{J(J+1) - j_1(j_1+1) - j_2(j_2+1)}{2\sqrt{j_1(j_1+1)j_2(j_2+1)}}$$

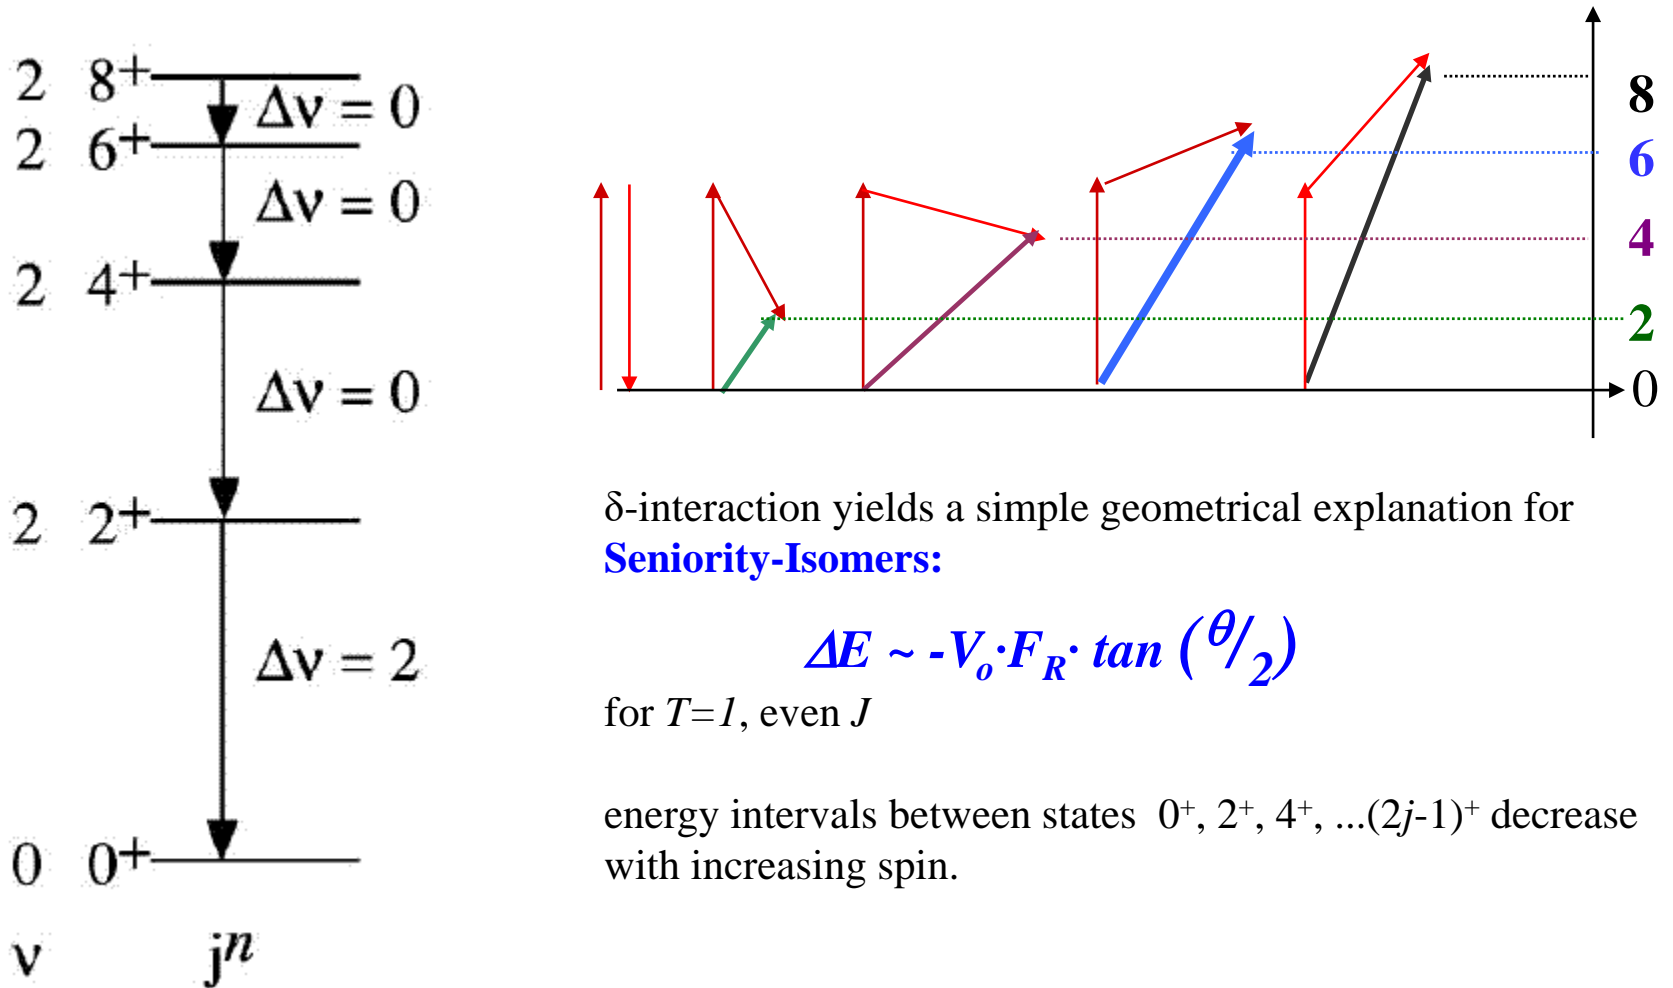

$$\cos\theta \cong \frac{J^2 - 2j^2}{2j^2} \quad \text{for } j_1 = j_2 = j \quad \text{and } j, J \gg 1$$

$\theta = 0^\circ$  belongs to **large J**,  $\theta = 180^\circ$  belongs to **small J**

*example  $h_{11/2}^2$ :* J=0  $\theta=180^\circ$ , J=2  $\theta \sim 159^\circ$ , J=4  $\theta \sim 137^\circ$ ,  
J=6  $\theta \sim 114^\circ$ , J=8  $\theta \sim 87^\circ$ , J=10  $\theta \sim 49^\circ$

$$\sin\theta = \sqrt{1 - \cos^2\theta} = \frac{J}{j} \left[ 1 - \frac{J^2}{4j^2} \right]^{1/2} \quad \sin\frac{\theta}{2} = [(1 - \cos\theta)/2]^{1/2} = \left( 1 - \frac{J^2}{4j^2} \right)^{1/2}$$

$$\begin{pmatrix} j & j & J \\ 1/2 & -1/2 & 0 \end{pmatrix}^2 \approx \left( 1 - \frac{J^2}{4j^2} \right) \frac{1}{\pi} \frac{1}{Jj \left( 1 - \frac{J^2}{4j^2} \right)^{1/2}} = \frac{\sin^2(\theta/2)}{\pi \cdot j^2 \cdot \sin\theta} = \frac{\tan(\theta/2)}{\pi \cdot j^2}$$

# Generalized seniority scheme

Seniority quantum number  $\nu$  is equal to the number of unpaired particles in the  $\mathbf{j}^n$  configuration, where  $\mathbf{n}$  is the number of valence nucleons.

energy spacing between  $\nu=2$  and ground state ( $\nu=0, J=0$ ):

$$\begin{aligned}
 E(j^n, \nu = 2, J) - E(j^n, \nu = 0, J = 0) &= \langle j^2 J | V | j^2 J \rangle + \frac{n-2}{2} \cdot V_0 - \frac{n}{2} \cdot V_0 \\
 &= \langle j^2 J | V | j^2 J \rangle - V_0 \quad \text{independent of } \mathbf{n}
 \end{aligned}$$

energy spacing within  $\nu=2$  states:

$$\begin{aligned}
 E(j^n, \nu = 2, J) - E(j^n, \nu = 2, J') &= \left[ \langle j^2 J | V | j^2 J \rangle + \frac{n-2}{2} \cdot V_0 \right] - \left[ \langle j^2 J' | V | j^2 J' \rangle + \frac{n-2}{2} \cdot V_0 \right] \\
 &= \langle j^2 J | V | j^2 J \rangle - \langle j^2 J' | V | j^2 J' \rangle \quad \text{independent of } \mathbf{n}
 \end{aligned}$$

# Generalized seniority scheme

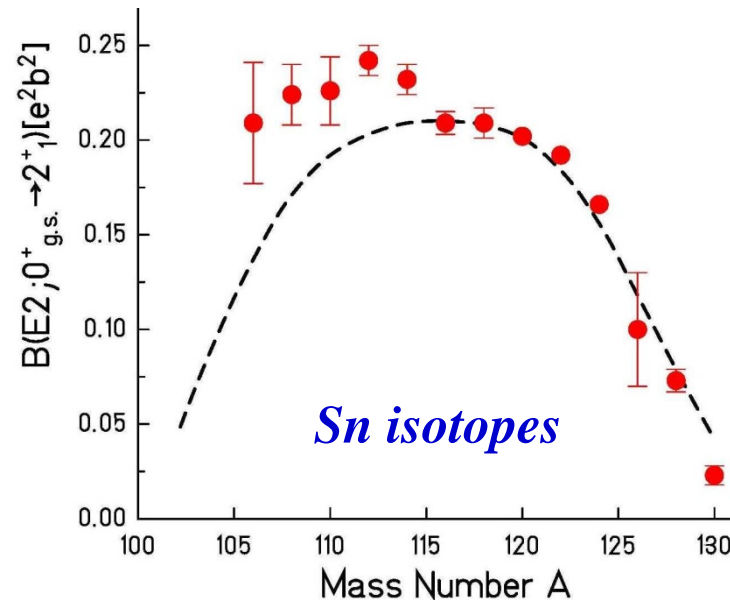

Seniority quantum number  $\nu$  is equal to the number of unpaired particles in the  $\mathbf{j}^n$  configuration, where  $\mathbf{n}$  is the number of valence nucleons.

E2 transition rates: 
$$B(E2; J_i \rightarrow J_f) = \frac{1}{2 \cdot J_i + 1} \cdot \langle J_f || Q || J_i \rangle^2$$

$$\begin{aligned} \langle j^n J = 2 || Q || j^n J = 0 \rangle^2 &= \left[ \frac{n \cdot (2j + 1 - n)}{2 \cdot (2j - 1)} \right] \cdot \langle j^2 J = 2 || Q || j^2 J = 0 \rangle^2 \\ &= \left[ \frac{(2j + 1)^2}{2 \cdot (2j - 1)} \right] \cdot f \cdot (1 - f) \cdot \langle j^2 J = 2 || Q || j^2 J = 0 \rangle^2 \quad f = \frac{n}{2j + 1} \rightarrow 1 \text{ for large } n \end{aligned}$$

$$\begin{aligned} B(E2; 2_1^+ \rightarrow 0_1^+) &\approx f \cdot (1 - f) \\ &\approx N_{\text{particles}} * N_{\text{holes}} \end{aligned}$$

# Generalized seniority scheme

Seniority quantum number  $\nu$  is equal to the number of unpaired particles in the  $\mathbf{j}^n$  configuration, where  $\mathbf{n}$  is the number of valence nucleons.

$$B(E2; 2_1^+ \rightarrow 0_1^+) \approx f \cdot (1 - f)$$

$$\approx N_{\text{particles}} * N_{\text{holes}}$$

$$\sum_j (2j + 1) \equiv \text{number of nucleons between shell closures}$$

Seniority quantum number  $\nu$  is equal to the number of unpaired particles in the  $\mathbf{j}^n$  configuration, where  $\mathbf{n}$  is the number of valence nucleons.

E2 transition rates that do not change seniority ( $\nu=2$ ):

$$\begin{aligned}\langle j^n J \| Q \| j^n J' \rangle &= \left[ \frac{2j + 1 - 2n}{2j - 3} \right] \cdot \langle j^2 J \| Q \| j^2 J' \rangle \\ &= \frac{2j + 1}{2j - 3} \cdot [1 - 2f] \cdot \langle j^2 J \| Q \| j^2 J' \rangle\end{aligned}$$

# $T_z = +1$ nucleus $^{94}\text{Pd}$

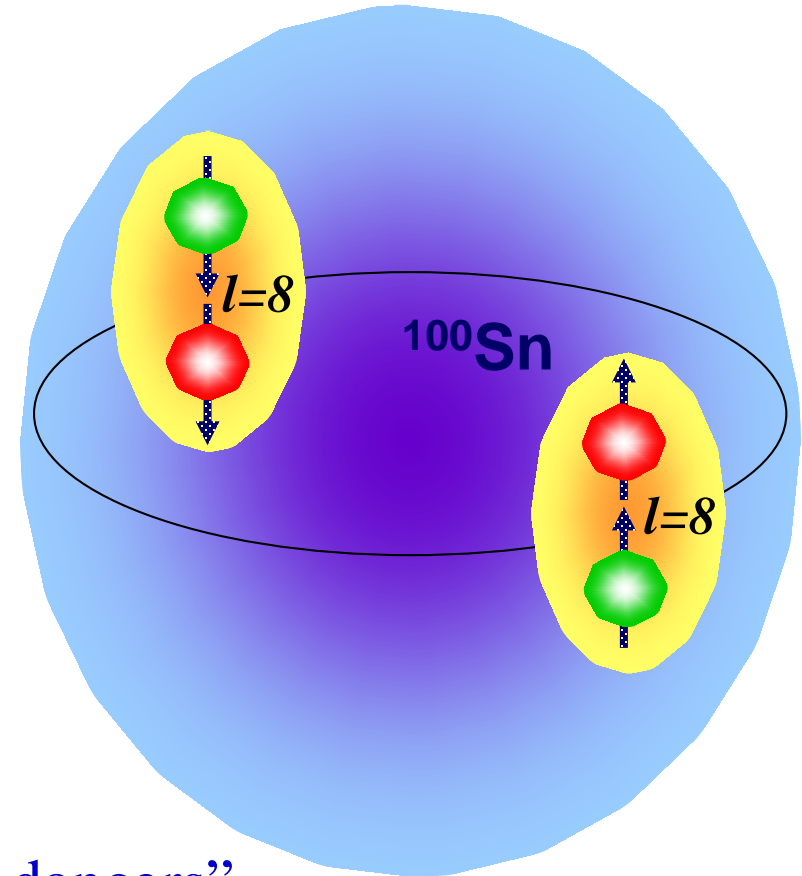

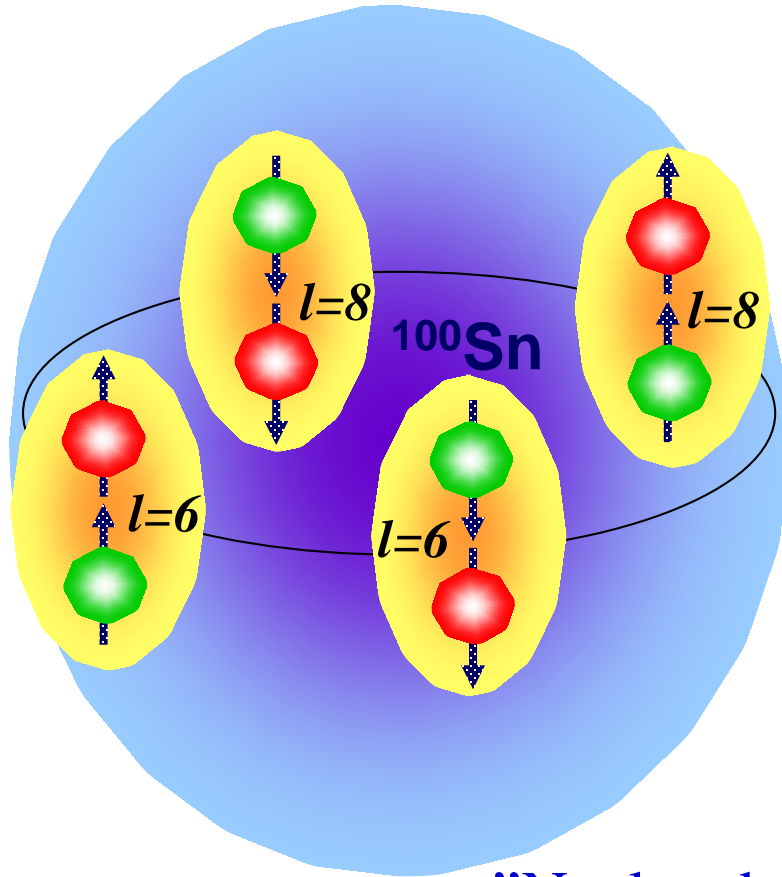

$T_{z,\pi} = -1/2$  for protons  $T_{z,\nu} = +1/2$  for neutrons

# New manifestation of T=0 np “pairing”?

$^{92}\text{Pd}$

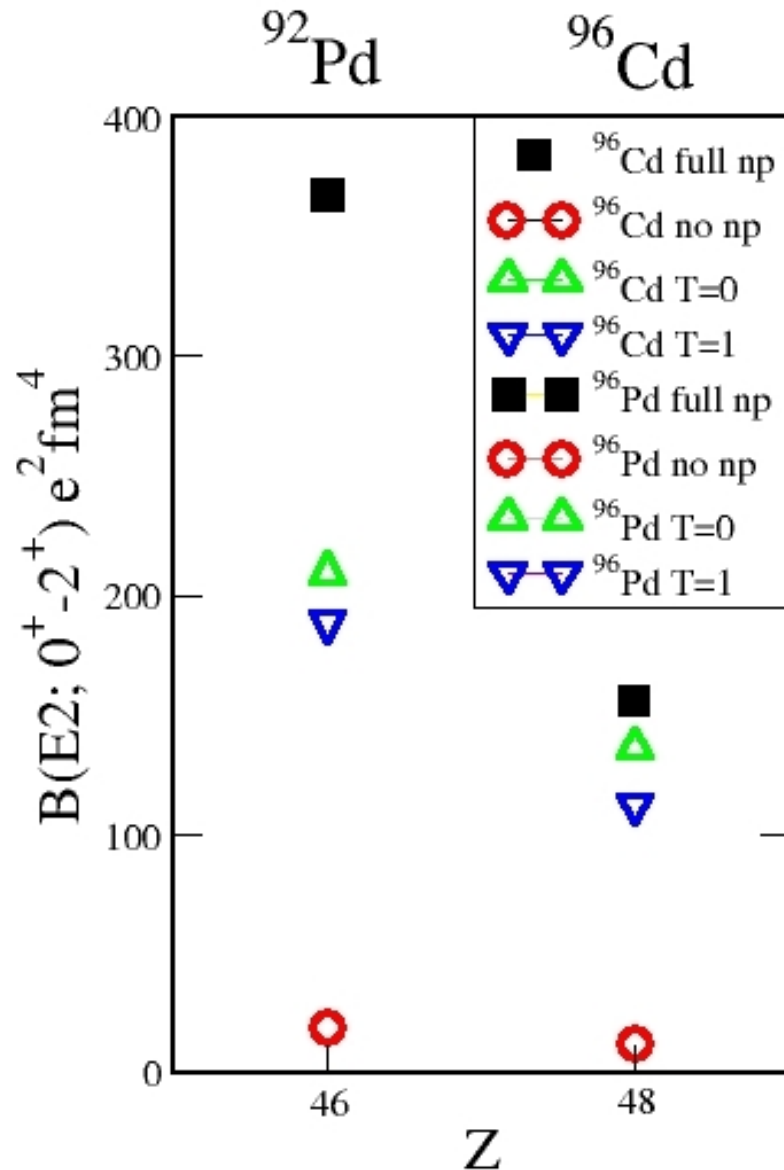

$^{96}\text{Cd}$

”Nuclear belly dancers”

Special deuteron-hole cluster like ground states imply significant deformation

# $B(E2; 0^+ \rightarrow 2^+)$ – sensitive probe of neutron-proton interactions

Shell model calculations by J. Blomqvist, R. Liotta, C. Qi

## Te experimental $E(2^+)$ and $B(E2; 2^+ \rightarrow 0^+)$

### Quadrupole collectivity

The traditional view of the mechanism behind deformation and collectivity: **long range np QQ interactions**

Enhancement of collectivity due to **np (short-range) pairing correlations** predicted in new calculations by D.S Delion, R. Liotta *et al.*

- ❖ Evidence for onset of collectivity, possibly induced by np pairing in neutron deficient Te and Xe nuclei

## Xe experimental $E(2^+)$ and $B(E2; 2^+ \rightarrow 0^+)$

### Quadrupole collectivity

The traditional view of the mechanism behind deformation and collectivity: **long range np QQ interactions**

Enhancement of collectivity due to **np (short-range) pairing correlations** predicted in new calculations by D.S Delion, R. Liotta *et al.*

- ❖ Evidence for onset of collectivity, possibly induced by np pairing in neutron deficient Te and Xe nuclei

# Appendix

$$B(E2; J_i \rightarrow J_f) = \frac{1}{2 \cdot J_i + 1} \cdot \langle J_f \| Q \| J_i \rangle^2$$

*Seniority changing:  $\Delta v = 2$*

$$\begin{aligned} \langle j^n J = 2 \| Q \| j^n J = 0 \rangle^2 &= \left[ \frac{n \cdot (2j + 1 - n)}{2 \cdot (2j - 1)} \right] \cdot \langle j^2 J = 2 \| Q \| j^2 J = 0 \rangle^2 \\ &= \left[ \frac{(2j + 1)^2}{2 \cdot (2j - 1)} \right] \cdot f \cdot (1 - f) \cdot \langle j^2 J = 2 \| Q \| j^2 J = 0 \rangle^2 \quad f = \frac{n}{2j + 1} \rightarrow 1 \text{ for large } n \end{aligned}$$

*Seniority conserving:  $v \rightarrow v$*

$$\begin{aligned} \langle j^n J \| Q \| j^n J \rangle &= \left[ \frac{2j + 1 - 2n}{2j + 1 - 2v} \right] \cdot \langle j^2 J \| Q \| j^2 J \rangle \\ &= \frac{2j + 1}{2j + 1 - 2v} \cdot [1 - 2f] \cdot \langle j^2 J \| Q \| j^2 J \rangle \quad f = \frac{n}{2j + 1} \rightarrow 1 \text{ for large } n \end{aligned}$$

*Example: quadrupole moments* this is why nuclei are prolate at the beginning of a shell and oblate at the end.
